HIGHLIGHTS

Lake States

Pulpwood production rose 13 percent to a record 7.71 million cords in 1986. Hardwood pulpwood output (production) climbed 824 thousand cords (16 percent), and softwood output increased 46 thousand cords (3 percent). Eight percent of the total production was whole-tree chips; aspen remained the preferred species. Production of pulpwood increased 12 percent for pulp mills and 14 percent for flakeboard mills. Pulpwood output rose 18 percent in Michigan, 13 percent in Wisconsin, and 5 percent in Minnesota. Michigan's white birch harvest in 1986 was double that in 1985. Aspen harvested in Wisconsin reached a record high for the fourth consecutive year. In Minnesota, 78 out of every 100 cords of roundwood were aspen.

Softwood residue imports to the Lake States from other States (primarily South Dakota and Wyoming) fell to 114 thousand cords. Eighteen percent of Wisconsin's pulpwood requirements came from out of State. Michigan received 8 percent of its pulpwood needs from out of State.

Central States

Central States pulpwood production fell 18 percent to 331 thousand cords. Output dropped in Indiana and Missouri but rose in Illinois and Iowa. Two out of every three cords were residue from wood-using mills. Indiana accounted for 46 percent of the output, but had the lowest total production since 1975. Fifty-nine percent of the Central States output was exported to five adjacent States.

Pulpwood receipts climbed 1 percent to 138 thousand cords. Only 1 thousand cords were imported.

PULPWOOD PRODUCTION IN THE NORTH-CENTRAL REGION BY COUNTY, 1986

James E. Blyth *and* W. Brad Smith

Pulpwood constitutes more than half the industrial timber products harvested annually in the Lake States (Michigan, Minnesota, and Wisconsin) and is an important product in the Central States (Illinois, Indiana, Iowa, and Missouri).

Current detailed information about pulpwood production¹ is necessary for intelligent planning and decisionmaking in wood procurement, forest resource management, and forest industry development. Also, scientists need current pulpwood information to plan research projects.

Since 1979, we have included logs, bolts, and wood residue used in manufacturing particleboard, waferboard, oriented strand board, and medium density fiberboard in this annual report. Together, these products are called flakeboards. Wood used at flakeboard mills is identical or nearly identical to wood used at pulp mills.

Because flakeboard mills use primarily aspen and wood residue, including them does not distort roundwood use trends for other species nor preclude comparing 1986 survey results with those of 1978 and previous years.

Pulp and flakeboard mills using North Central States timber in 1986 reported their pulpwood receipts² by species groups and counties of origin. This report presents the results of the survey, analyzes the data where appropriate, compares results with 1985 or earlier years, and discusses trends in pulpwood production and use.

The Lake States and Central States are discussed separately because the timber types in each area are different and less information can be released about the Central States (more detailed data on pulpwood production and receipts in the Central

States would reveal the operations of individual mills). This is the 28th annual report of the pulpwood harvest in Lake States counties and the 27th annual report of the Central States harvest.

Several mills buy their pulpwood in green tons rather than in cords. Conversion factors used in the Lake States to convert green tons of pulpwood to standard cord equivalents are shown in the Appendix. Conversion factors used in the Central States are shown in footnote 1 of table 4.

Pulpwood production in Minnesota is completely and accurately shown. However, to prevent disclosure of confidential information about softwood pulpwood use by individual companies, the total quantity of softwood pulpwood imports and exports between Minnesota and Canada is not reported. [Thus, some Minnesota softwood shipped to Canada is shown as remaining and used in Minnesota, and receipts of Canadian softwood in Minnesota are understated].

LAKE STATES Production

Pulpwood production climbed to a record 7.71 million cords³ in 1986 from 6.84 million cords in 1985, a gain of 13 percent (table 1). The previous record of 7.19 million cords in 1984 was surpassed by 7 percent. New highs in output have been reached in 5 of the last 8 years. Of each 100 cords produced, 92 cords were

¹*Pulpwood production, determined from mill receipts, is the annual volume of pulpwood cut in a specific county or region, plus the annual wood residue volume produced by sawmills, veneer mills, etc., in a specific State or region that was used for pulp, particleboard, waferboard, oriented strand board, or medium density fiberboard.*

²*Pulpwood receipts are the volume of wood received by mills in a specific State or region, regardless of the geographic source.*

³*All references to cords are in standard cords. A standard cord is 128 cubic feet of wood, bark, and air space.*

JAMES E. BLYTH is a Principal Market Analyst, and W. BRAD SMITH is a Principal Mensurationist with the North Central Forest Experiment Station, St. Paul, Minnesota.

^{1/}Vertical columns of figures under the box heading "Production by States", present the amount of pulpwood cut in each State.

^{2/}Mostly western States.

^{3/}Pulpwood shipped to mills outside of region.

^{4/}Ponderosa pine.

roundwood (including chips from roundwood); the remainder was residue from wood-using plants.⁴

Principal species harvested were aspen (3,656 thousand cords), jack pine (583 thousand cords), hard maple (429 thousand cords), and white birch (419 thousand cords). Other major species each furnishing more than 200,000 cords were soft maple, red pine, balsam fir, and spruce.

Of the total pulpwood production, 78 percent was hardwoods, the highest proportion ever recorded, and a record 5.99 million cords, up 16 percent from 1985. Nearly all (99 percent) of the hardwood gains were in roundwood. Aspen increased the most in volume, followed by white birch, hard maple, and soft maple; each of these species was at record production levels. Only elm and balsam poplar had smaller harvests than in 1985.

Although the softwood proportion of the total production dropped from 24 percent in 1985 to 22 percent in 1986, total softwood output rose by 46 thousand cords. Most of the gain was in softwood residue, which reached a record output of 150 thousand cords. Roundwood harvest increases were concentrated in red pine and jack pine, while the major decline was in balsam fir.

Lake States whole-tree chip⁵ (WTC) production rose 11 percent to 635 thousand cords and accounted for about 1 out of 12 cords of Lake States pulpwood output. WTC production from softwood and aspen fell, but output from other hardwoods climbed 54 percent. About 1 out of 5 cords produced in Michigan was WTC. After a sharp drop in 1985, Minnesota WTC output partially recovered. Wisconsin WTC output declined slightly and remained nominal. Production of WTC by species group and State was:

State	Softwoods	Aspen	Other hardwoods
	(Thousand cords)		
Michigan	79	235	226
Minnesota	--	62	--
Wisconsin	--	28	5

Michigan.—Michigan's production of 2.81 million cords in 1986 eclipsed the old 1984 record by 17 per-

cent. Increases in output were mainly in hard maple, soft maple, and white birch. White birch production was double that in 1985. About two-thirds of the hard maple was cut in the Western Upper Peninsula Unit. For the fourth consecutive year, aspen production reached a new high. The annual aspen harvest is up 55 percent since 1982. Three-fifths of the aspen was cut in the Northern Lower Peninsula Unit. Top-producing counties were Marquette, Delta, Iron, Menominee, and Dickinson.

Minnesota.—Minnesota producers supplied 1.98 million cords of pulpwood, up 5 percent from 1985. Aspen contributed most of the increase, with a gain of 108 thousand cords. Of every 100 cords of roundwood, 78 were aspen. For the first time ever recorded, the jack pine harvest fell below 100 thousand cords, but was offset by increases in red and white pine harvests. Five counties—St. Louis, Itasca, Koochiching, Beltrami, and Cass—supplied two-thirds of the roundwood.

Wisconsin.—Total production was at a new peak of 2.93 million cords in 1986, 13 percent above 1985. Aspen output reached a new record for the fourth consecutive year. Other species at peak production included white birch, red pine, hard maple, soft maple, and ash. Bayfield, Marinette, Forest, Oneida, and Vilas Counties were the leading roundwood producers.

In this report, we show the distribution of the harvest in two ways: first, the amount of pulpwood cut relative to the growing-stock volume in each of five major pulpwood species (fig. 1); and, second, the amount of pulpwood cut relative to commercial forest area (fig. 2). For the major supply areas, pulpwood harvesting was most intensive for jack pine in the Northeastern and Central Wisconsin Survey Units and the Western Upper Peninsula Unit of Michigan; for red pine in the Central Unit of Wisconsin; for spruce in the Northern Pine Unit of Minnesota and the Eastern Upper Peninsula Unit of Michigan; for balsam fir in the Northern Pine Unit of Minnesota and the Northeastern Wisconsin Unit; and for aspen in the Northeastern and Northwestern Wisconsin Units, the Northern Pine Unit of Minnesota, and the Northern Lower Peninsula Unit of Michigan.

⁴Residue is the byproduct from sawmills, veneer mills, cooperage mills, and other wood-using mills that is used for pulping and flakeboard. Residue includes slabs, edgings, veneer cores, sawdust, wood flour, and chips manufactured from slabs, edgings, and veneer cores.

⁵Pulpwood produced from chipping entire trees (all portions of trees above ground, except the stumps).

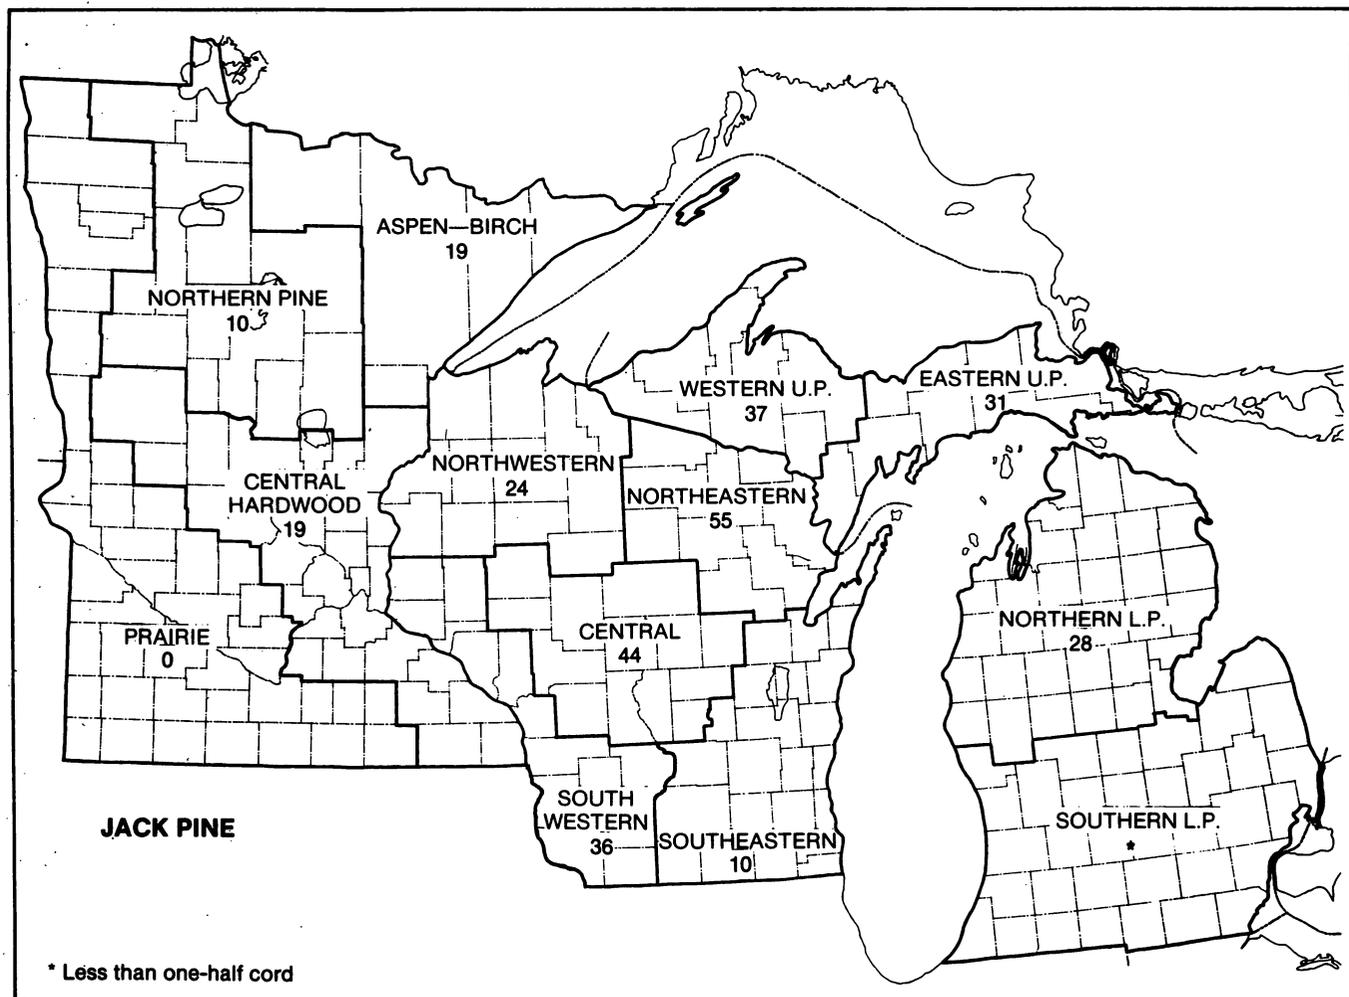

Figure 1.—Cords of roundwood pulpwood (including chips from roundwood) harvested per 1,000 cords of merchantable volume for each of five principal pulpwood species by Forest Survey Unit, 1986. Merchantable volume was determined during the last forest inventory in each State.

More than 250 cords of pulpwood were harvested per 1,000 acres of stocked commercial forest land in the following counties:

Michigan	Minnesota	Wisconsin
Delta	Clearwater	Florence
Menominee	Itasca	Forest
Dickinson	Mille Lacs	Langlade
Marquette		Lincoln
Crawford		Marinette
Mecosta		Oneida
Osceola		Vilas
		Bayfield
		Washburn

Receipts

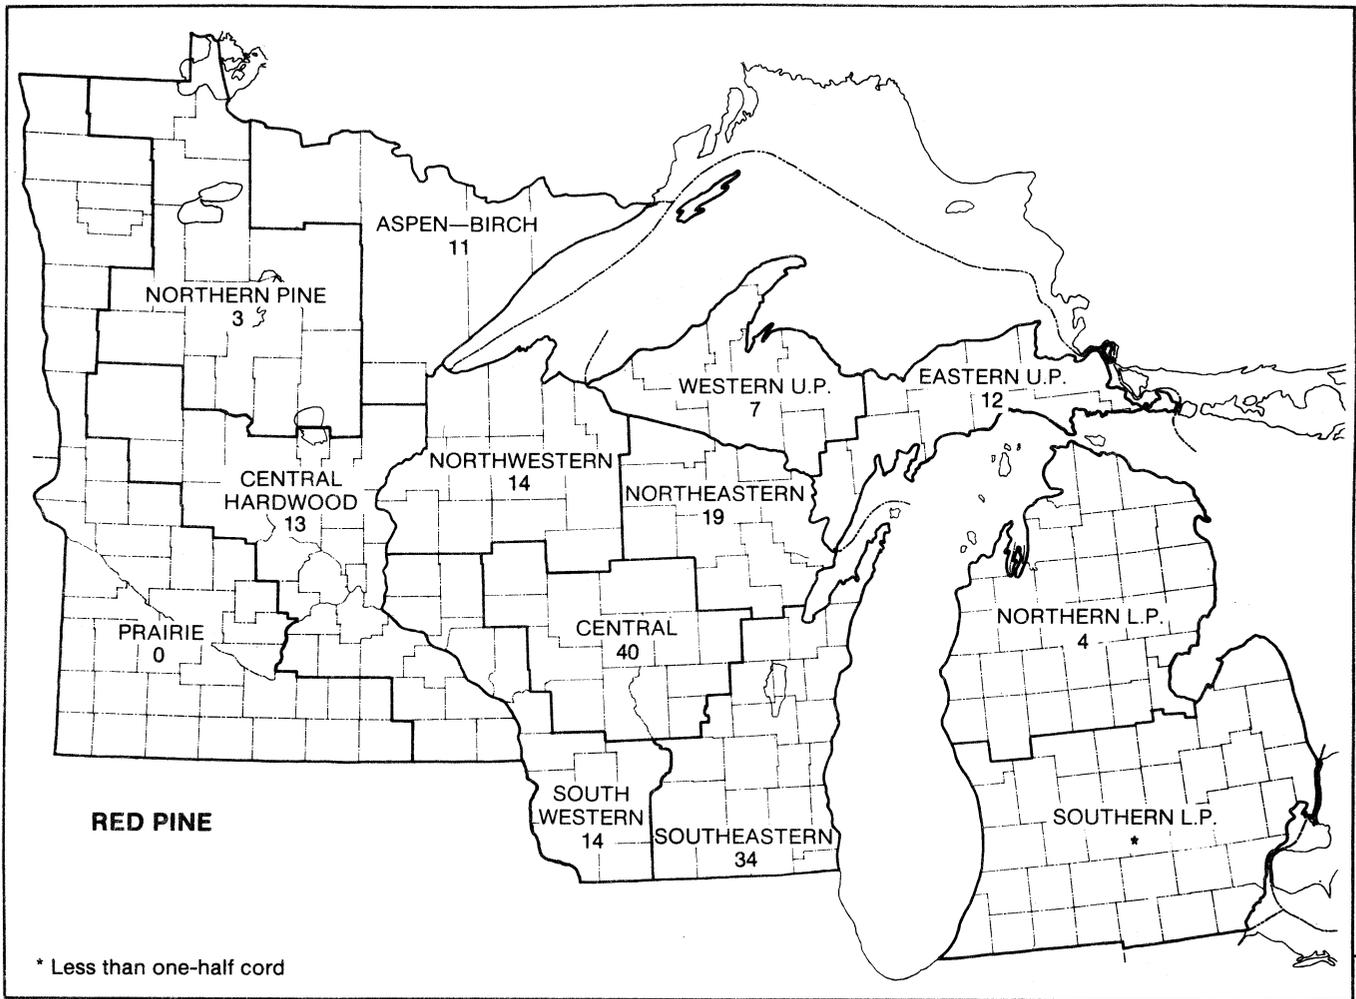

Thirty-six pulp and eleven flakeboard mills received 7.83 million cords of pulpwood in 1986, up 13 percent from 1985. Forty-one of forty-seven operating mills used aspen, 19 used birch, and 18 used maple (table 2).

Each Lake State furnishes many mills with pulpwood, including mills outside the Lake States area. During 1986, Michigan supplied 27 mills, Wisconsin supplied 27 mills, and Minnesota supplied 25 mills.

Softwood residue imports from Canada climbed for the second straight year after falling for 4 consecutive years. Shipments of softwood residue to the Lake States from other areas of the U.S. fell for the third year in a row to 114 thousand cords; South Dakota and Wyoming were the primary suppliers. Softwood residue imports from other areas of the U.S. peaked in 1973 at 295 thousand cords and have never been within 60 thousand cords of that level since then.

Michigan.—Eight percent of the 2.63 million cords received at 10 Michigan mills came from out of State. Principal imports were white birch, hardwood residue, and hard maple.

(Figure 1 continued)

Wisconsin.—Out-of-State sources supplied 18 percent of the 3.27 million cords to 23 Wisconsin mills. Michigan furnished 368 thousand cords, Minnesota 69 thousand cords, other (primarily Western) States 116 thousand cords, and Canada 23 thousand cords. Chief imports were aspen, softwood residue, jack pine, spruce, and hard maple.

Minnesota.—Minnesota pulpwood receipts are not fully reported (see earlier explanation).

Industry Trends and Analysis

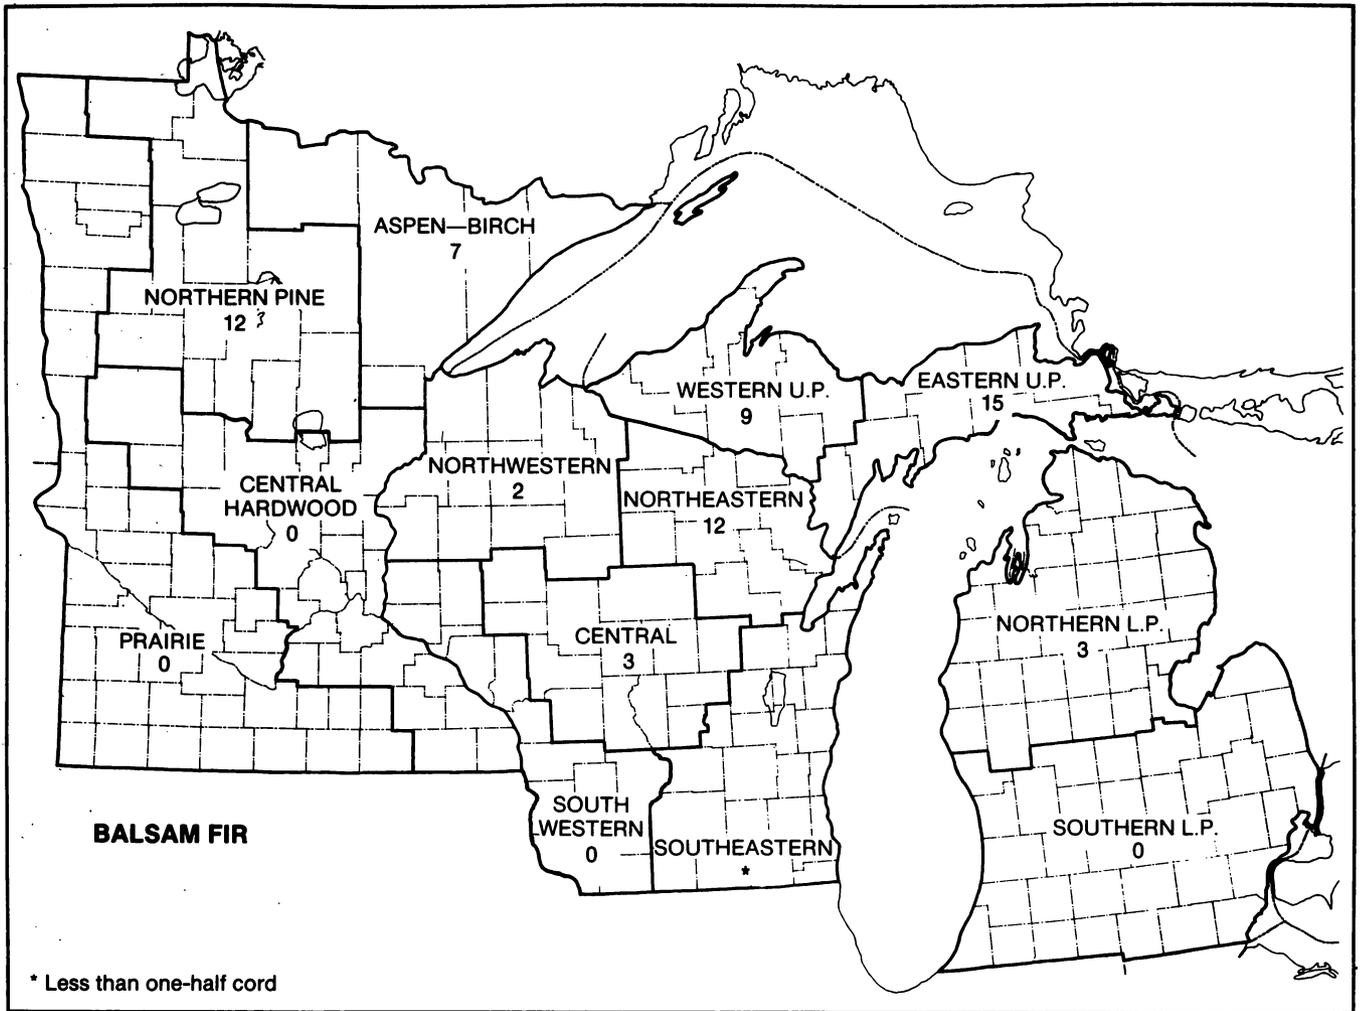

Pulp mills

Average daily pulp production rose 2 percent to 11,165 tons per day in 1986 (table 3). At least four mill expansions led to the increased production. One mill closed during 1986.

Lake States pulpwood production for pulp mills in 1984, 1985, and 1986 was:

Species	Production		
	1984	1985	1986
	(Thousand cords)		
Roundwood			
Aspen	2,273	2,109	2,202
Other species	2,899	2,672	3,210
Residue	493	452	470
Total	5,665	5,233	5,882

(Figure 1 continued)

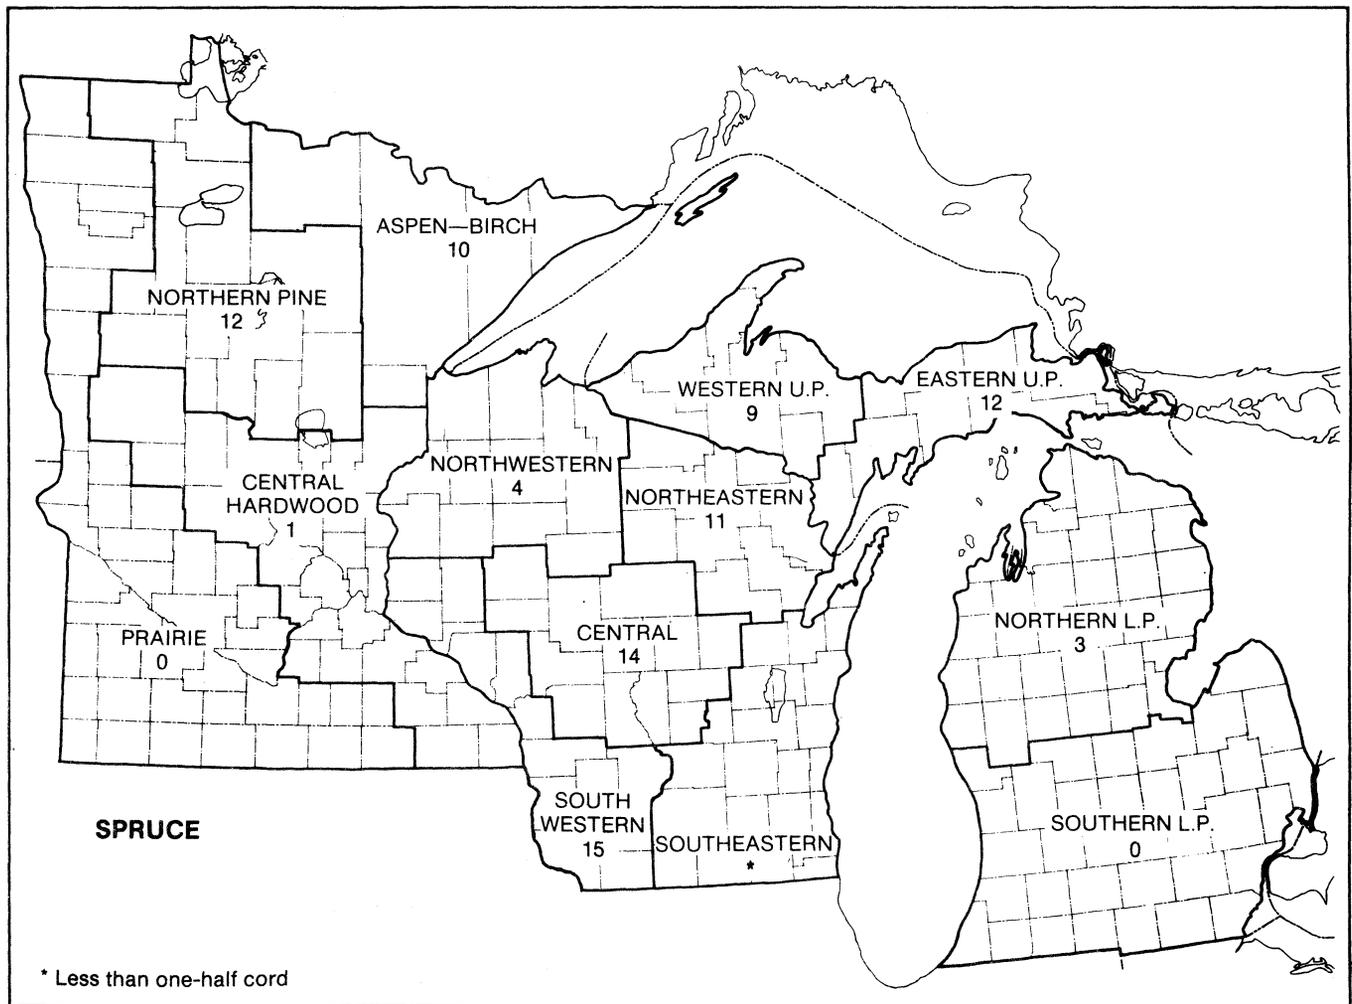

The 12-percent rise in Lake States pulpwood production for pulp mills is excellent compared with the 5.7 percent climb in U.S. woodpulp production in 1986.

Flakeboard mills

No new mills began production in 1986, but some relatively new mills were expanding their output. Annual production capacity of the Lake States flakeboard mills was 1,050 million square feet as shown in next column:

Company	Location	Capacity (Million square feet 3/4-inch basis)
Champion International Corp.	Gaylord, MI	175
Louisiana-Pacific	Newberry, MI	50
Weyerhaeuser Co.	Grayling, MI	160
Louisiana-Pacific	Two Harbors, MN	75
Blandin Wood Products Co.	Grand Rapids, MN	125
Northwood Panelboard Co.	Bemidji, MN	80
Potlatch Corp.	Bemidji, MN	80
Potlatch Corp.	Cook, MN	80
Louisiana-Pacific	Hayward, WI	130
Rodman Industries	Marinette, WI	30
Weyerhaeuser Co.	Marshfield, WI	65
All companies		1,050

(Figure 1 continued)

Lake States pulpwood production for flakeboard mills in 1984, 1985, and 1986 was:

Species	Production		
	1984	1985	1986
	(Thousand cords)		
Roundwood			
Aspen	1,284	1,302	1,455
Other species	158	215	259
Residue	85	93	117
Total	1,527	1,610	1,831

Lake States pulpwood production for flakeboard climbed 14 percent, partly because housing starts were 3.7 percent above those in 1985—1.806 million units in 1986, the highest unit total since 1978.

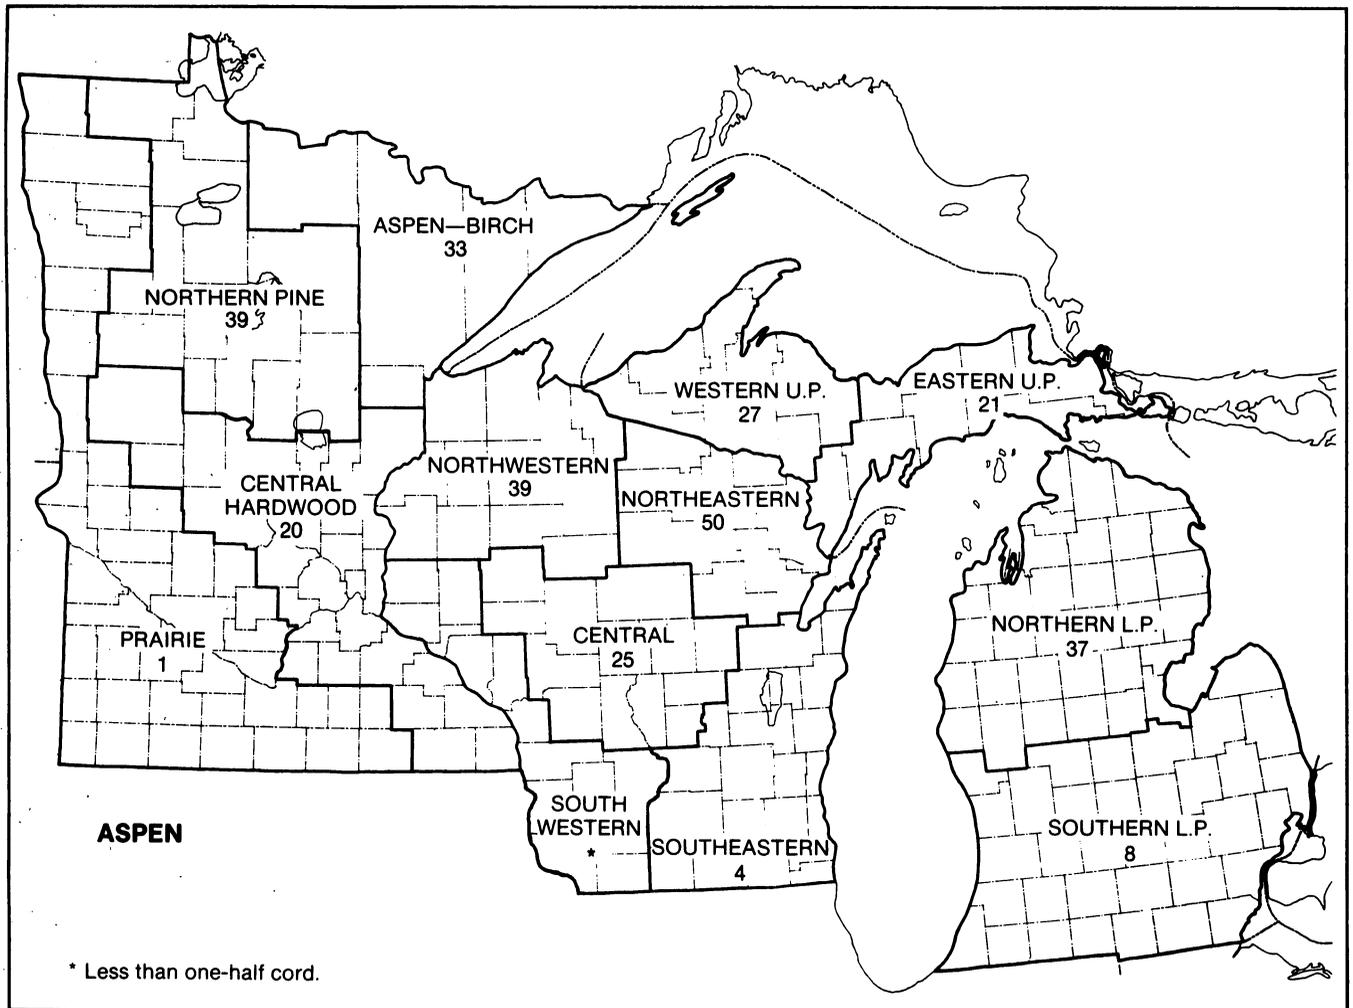

An overview of both industry segments in 1987 (pulp mills and flakeboard mills) shows three companies being acquired by other companies. Two new

mills (one pulp and one flakeboard) are expected to begin production in 1987; one pulp mill closed. A boiler explosion at one firm caused a temporary cutback in its pulp production. At least one mill is expanding pulping capacity, and another plans a major increase in pulping capacity by 1989.

CENTRAL STATES Production

Pulpwood production plunged 18 percent to 331 thousand cords (table 4), the lowest production since 1967. Two out of every three cords were residue. The harvest of soft hardwoods was the smallest ever recorded, displacing the previous low in 1982. Demand rose for hard hardwoods and softwoods and fell for Central States mill residue. Exports from the Central States (chiefly hardwood residue) fell below 200 thousand cords for the first time since

(Figure 1 continued)

1975. Fifty-nine percent of the pulpwood was shipped to Kentucky, Michigan, Wisconsin, Ohio, and Oklahoma mills.

Indiana, the leading producer, furnished 32 percent less pulpwood in 1986 than in 1985. Indiana's production was the lowest since 1975. Output was nominally higher in Illinois and Iowa in 1986 and slightly lower in Missouri.

Loggers harvested pulpwood in 22 Illinois counties, 18 Indiana counties, 16 Missouri counties, and 8 Iowa counties (fig. 3). Producing areas expanded in southern Illinois, central Indiana, and northeast Iowa, but contracted in east central Illinois and northeast Missouri.

Receipts

Three Central States pulp mills received 138 thousand cords in 1986 compared to 136 thousand cords in 1985. Higher receipts of hard hardwoods

and of hardwood residue from wood-using mills more than offset the drop in soft hardwood receipts. No softwoods were used for pulp in the Central States for the third consecutive year. Only 1 thousand cords were imported.

Industry Trends and Analysis

Average daily pulp production remained at 470 tons (table 5). No changes in average daily production are anticipated.

Mills in adjacent States are likely to remain the dominant markets for Central States pulpwood despite the precipitous drop in shipments to these mills in 1986. Pulpwood imports by Central States mills will probably remain nominal.

Hardwood residue from Central States wood-using mills should continue to be the dominant type of pulpwood in the Central States, notwithstanding the major decline in use during 1986.

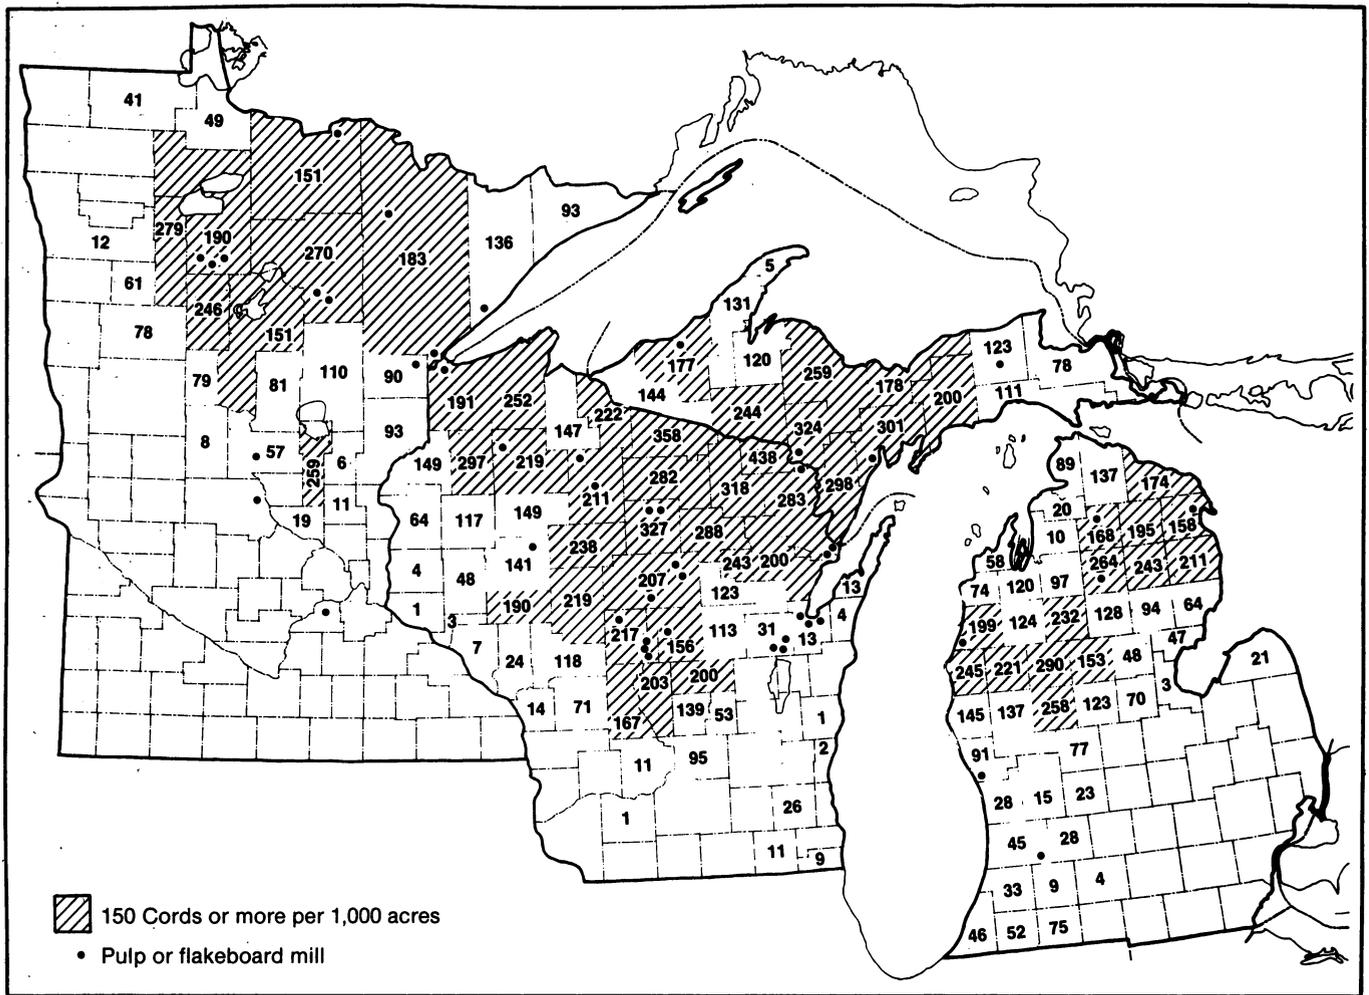

Figure 2.—Cords of pulpwood cut per 1,000 acres of stocked commercial forest land in principal pulpwood-producing counties, 1986. Acres of stocked commercial forest land (stocking of trees greater than 16.7 percent) were determined during the last forest inventory in each State. Locations of active pulp and flakeboard mills are shown.

Table 2.—Numbers of industrial plants in the Lake States using a particular species or residue for pulping and flakeboard in 1986

Blyth, James E.; Smith, W. Brad.

1988. Pulpwood production in the North-Central Region by county, 1986. Resour. Bull. NC-106. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station 26 p.

Discusses production and receipts for 1986 and production for recent years in the Lake and Central States. Shows Michigan, Minnesota, and Wisconsin production by species for each county and compares production by Forest Survey Unit with that of previous years. Presents 1986 production and receipt data for Illinois, Indiana, Iowa, and Missouri, and shows four production classes by county.

KEY WORDS: Roundwood, residue, receipts, Lake States, Central States.

FINDING OUT AND TELLING

Our job at the North Central Forest Experiment Station is discovering and creating new knowledge and technology in the field of natural resources and conveying this information to the people who can use it--in short, "finding out and telling." As a new generation of forests emerges in our region, managers are confronted with two unique challenges: (1) Dealing with the great diversity in composition, quality, and ownership of the forests, and (2) Reconciling the conflicting demands of the people who use them. Helping the forest manager to meet these challenges while protecting the environment is what research at North Central is all about.
