Manuscript approved for publication September 11, 1997
1997

This report includes the most commonly used U.S. Department of Agriculture, Forest Service, Forest Inventory and Analysis (FIA) statistics. Additional forest resource data can be obtained through FIA staff, through the use of an FIA CD-ROM, or through a table generator on the North Central Forest Experiment Station's Internet page. Persons requesting additional information from FIA staff are expected to pay the retrieval costs.

Requests may be directed to:

FOREWORD

FIA is a continuing endeavor as mandated by the Renewable Resources Research Act of 1978. The objective of FIA is to periodically inventory the Nation's forest land. Up-to-date resource information is essential to frame forest policies and programs. USDA Forest Service regional experiment stations are responsible for conducting these inventories.

Fieldwork for the fifth forest inventory of Wisconsin was begun in August of 1993 and completed in August of 1996. More accurate survey information was obtained during this survey than otherwise would have been feasible because sampling intensity was increased to a double intensity level statewide. Such sampling was made possible through the cooperation, assistance, and additional funding provided by the State of Wisconsin.

The State of Wisconsin funding enabled FIA to measure twice as many field plots as would have been possible solely with Federal funds. As a result, the accuracy of the resulting FIA data was greatly improved.

Notice to users of the 1996 inventory of Wisconsin's forest resources results:

Data from new inventories are often compared with data from earlier inventories to determine trends in forest resources. However, for the comparisons to be valid, the procedures used in the two inventories must be similar. As a result of our ongoing efforts to improve the efficiency and reliability of the inventory, several changes in procedures and definitions have occurred since the last Wisconsin inventory in 1983. Because some of these changes will make it inappropriate to directly compare the 1996 data with those published for 1983, data from the 1983 inventory have been reprocessed using the 1996 procedures. Please refer to the section labeled "Comparing Wisconsin's fifth inventory with the fourth inventory" in the appendix for more details.

Perhaps the most significant change between inventories was the development of new volume tables between the 1983 and 1996 inventories of Wisconsin's forest resources. The new volume tables, developed by USDA Forest Service research scientists and other cooperating researchers, more accurately estimate the true growing-stock and sawtimber volume. In general, the old volume tables used in the previous inventories underestimated the true volume. As a part of the current inventory, we updated the 1983 inventory using the new volume tables. As a result, the volumes that were recalculated for the 1983 inventory show an increase from the previously published volumes (Resource Bulletins NC-94 - Wisconsin Forest Statistics and NC-107 - Wisconsin's Fourth Forest Inventory, 1983). All tables with 1983 data, and comparisons to the 1983 inventory results, in this publication reflect the recalculated volumes.

FIA staff located in St. Paul, Minnesota, involved in the fifth inventory of Wisconsin included Beth Collins, Sheri De Cora, Barb Freund, Tom Gearhart, Dan Goodman, Dale Gormanson, Dan Groen, Ron Hackett, Mark Hansen, David Haugen, Doug Hecker, Jennifer Iole, Mike Johnson, Neal Kingsley, Barb Knight, Earl Leatherberry, Troy Lindgren, Joel Lemberg, Dennis May, Doug Magee, Pat Miles, Jerry Ostrom, Ron Piva, Gerhard Raile, Mary Jo Resendez, Jay Solomakos, Dan Wendt, and Suzanne Willhite.

FIA field staff involved in this inventory were Todd Anderson, John Benaszewski, Avery Beyer, Elaine Boanshick, Dan Brooks, Kurt Buckler, Jody Buffman, Michael Burns, Paul Castillo, John Crittenden, Brian De Byl, Graig Farrer, Jay Flynn, Duane Fogard, Rodney Fouks, Kristen Goodrich (Weber), Nathan Goodrich, Mark Gossman, William Groth, Dean Halvorson, Cheri Hartless, Patrick Hartless, Doug Hecker, Glenda Hefty, Gary Inhelder, Nicholas Kestle, Marsha Klein, Daniel Klocek, Peter Koehler, Scott Lancaster, Keith Magunsson, Mark Majewsky, Lisa McDonald, Tim Miller, Jeffery Morse, Daniel Nelson, Eric Oliphant, Wilfred Ortiz, Paul Perdew, Lawrence Plucinski, Edward Reiss, Kevin Sheppard, Daniel Sherrill, Trevor Sommers, Gary Stachowicz, Eric Stanton, Richard Steensma, James Stelick, Heidi Troyer (Waymann), Andrew Tuttle, Jerry Van Cleve, James Veiman, Brad Witkin, Erin Witkin, and Christopher Yonkers.

Wisconsin Forest Statistics, 1996

Thomas L. Schmidt

Wisconsin, well known for its water quality, outdoor recreation, and dairy products, is also recognized for its forests and the goods and services they provide. For example, Wisconsin is the Nation's leading paper-producing State. The State's forests play an important role in

the lives of Wisconsin citizens, ranging from providing employment and other economic contributions to improving and protecting the State's soil and water resources. Wisconsin is divided into five sampling units (fig. 1).

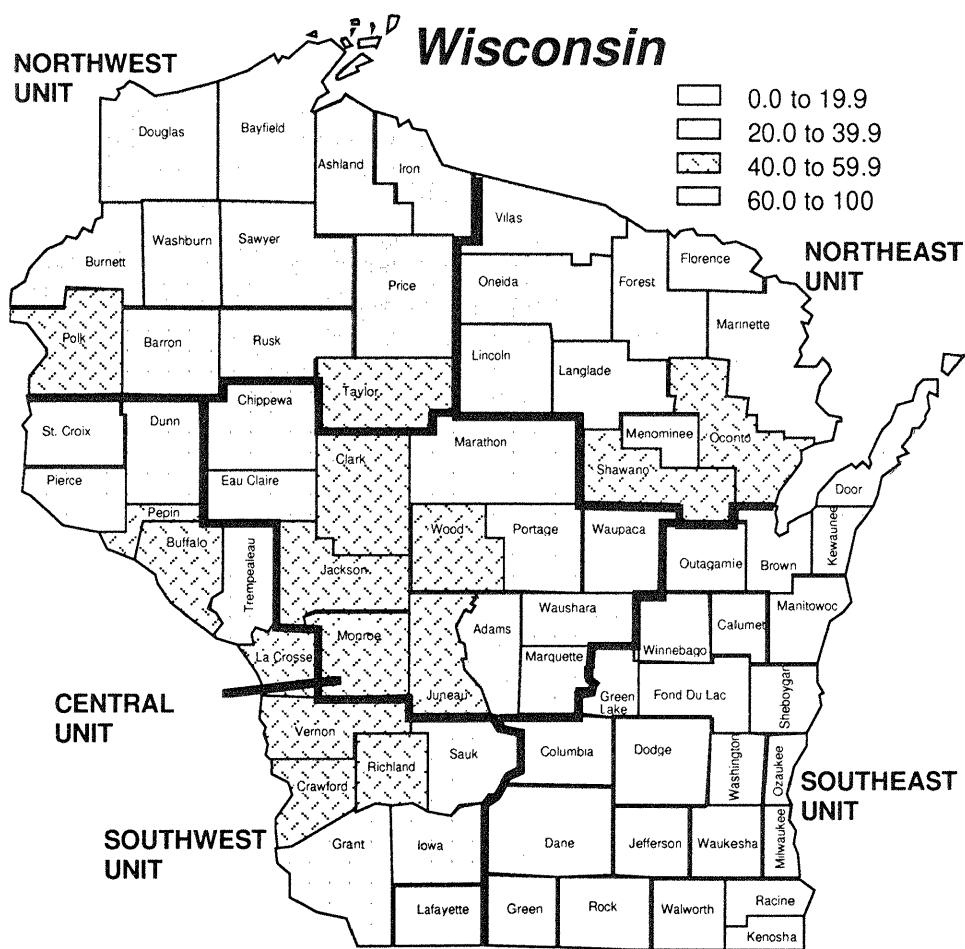

Figure 1.—Forest land as a percent of land area by county, and Forest Survey Units, Wisconsin, 1996.

Thomas L. Schmidt is a Research Forester in the Forest Inventory and Analysis Program at the North Central Forest Experiment Station, St. Paul, Minnesota.

HIGHLIGHTS

- The area of Wisconsin's forests continued to increase between inventories, continuing a trend that began in the 1970's. The primary cause of this increase is the reversion of marginal agricultural land back to forest land.
 - Net growth exceeds harvest in Wisconsin. Sawtimber average annual net growth exceeded harvest by more than 40 percent between 1983 and 1996.
 - As a result of the expanding resource and tree growth greater than trees harvested, the volume of trees growing in Wisconsin continued to increase in the 1996 inventory.
 - The majority of the increase in area of forest land between inventories, occurred in young forests. Since young trees tend to grow faster than older trees (average growth rates tend to slow down as trees age), future growth in Wisconsin's forests is expected to continue to increase.
 - Between inventories, an average of 100 million new growing-stock trees became established each year in Wisconsin. As a result, there were almost 1.4 billion more growing-stock trees in 1996 than in 1983.
 - The future of the forest lies in the hands of individual private landowners, who own almost 60 percent of the total area of timberland in Wisconsin.
 - The extensive State and county ownership of forest land is a distinctive feature of the Lake States region compared to other regions in the Eastern U.S. State and county ownership represents 26 percent of the total area of forest land in the Lake States compared to an average of 6 percent for the Nation (Webster, pers. comm.).
- Extent of Wisconsin's Forests**
- The area of forest land in Wisconsin has been steadily increasing in recent decades. Forest land increased from 14.9 million acres in 1968 to 15.3 million acres in 1983 to 16.0 million acres in 1996. Currently, the area of forest land in Wisconsin represents 46 percent of the total land area.
 - All five Survey Units increased in area of timberland between inventories. The greatest increase in area of timberland occurred in the Northeast Unit, which rose from 3.8 to 4.2 million acres between 1983 and 1996.
 - Currently, the Northeast Unit is the most heavily forested unit with 7 out of every 10 acres classified as timberland. Conversely, in the Southeast Unit, only slightly more than 1 out of every 10 acres are classified as timberland. The Southeast Unit is the most urbanized and agricultural part of the State. The percent of the total area of land classified as timberland for the five units is: Northeast, 73 percent; Northwest, 68 percent; Central, 43 percent; Southwest, 33 percent; and Southeast, 13 percent.
 - Individual private landowners are the largest group of timberland owners in Wisconsin, owning more than 57 percent of all timberland in 1996. Counties and municipalities are the largest group of public owners, holding 15 percent of the total area of timberland in Wisconsin (fig. 2).
 - Bayfield County continued to be the lead county in terms of total area of timberland (740,000 acres in 1983 and 772,000 acres in 1996).
 - Currently, Bayfield, Marinette, Sawyer, Douglas, Price, Oneida, Forest, and Ashland Counties all have more than a half million acres of timberland.
 - Despite the overall increase in area of timberland, some counties decreased in area of timberland between inventories. The majority of these counties are located in the southern portions of Wisconsin. The primary reason for a decrease in area of timberland was urban and suburban development.

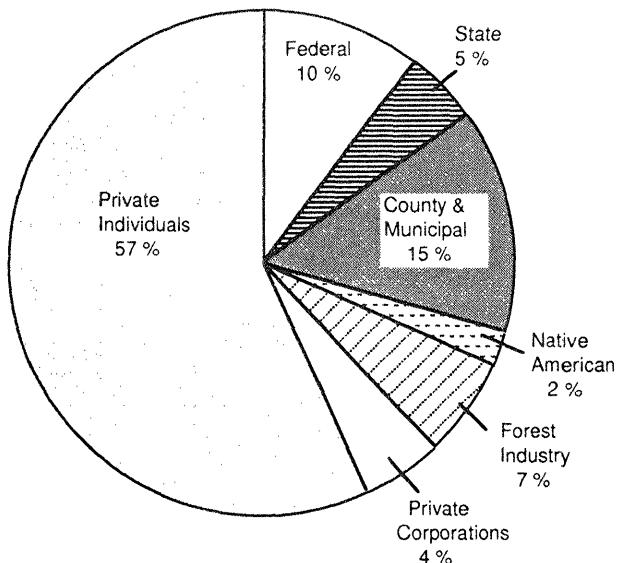

Figure 2.—*Distribution of timberland, by owner, Wisconsin, 1996.*

Composition of Wisconsin's Forests

- Wisconsin's forests are predominately hardwoods with 84 percent of the total area of timberland classified as hardwood forest types. Currently, the primary hardwood forest type in Wisconsin is maple-beech-birch with 5.3 million acres (fig. 3).

- Currently, conifer forest types represent 16 percent of the total area of timberland in Wisconsin. Pine forest types account for 8 percent, swamp conifers 6 percent, and spruce-fir 2 percent of the total area of timberland.
- Between 1983 and 1996, the area of jack pine, white pine, balsam fir, northern white-cedar, aspen, and paper birch declined. The decline in area of jack pine, aspen, and paper birch was primarily due to natural succession as these shade-intolerant species aged and were replaced by more shade-tolerant species.
- Mid- to late-successional forest types increased in area between 1983 and 1996. For example, the area of maple-beech-birch increased from 4.1 million acres to 5.3 million acres.
- Between inventories, the area of sawtimber- and poletimber-size stands decreased, by 6 percent and 1 percent, respectively, while sapling-seedling-size stands increased by 37 percent. In 1996, poletimber-size stands accounted for 41 percent, sapling-seedling-size stands 31 percent, and sawtimber-size stands 28 percent of the total area of timberland in Wisconsin (fig. 4).

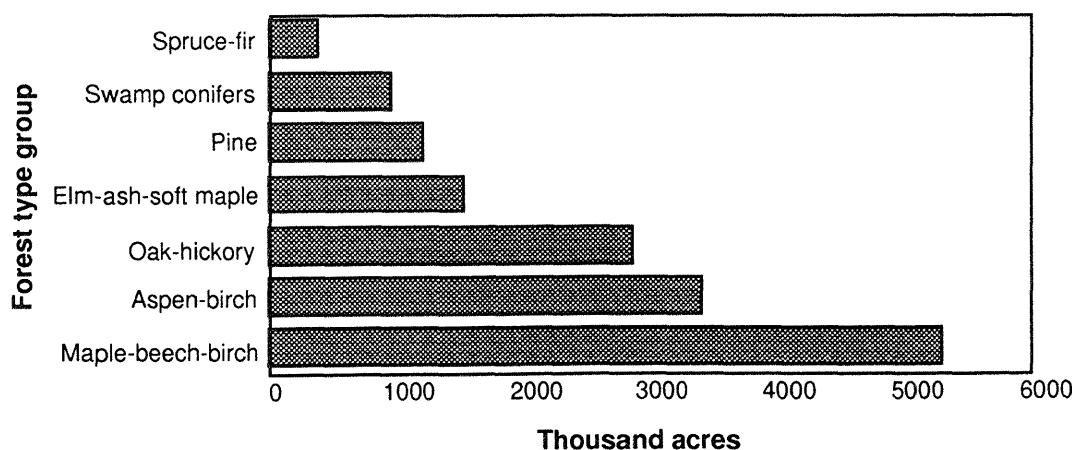

Figure 3.—*Area of timberland by forest type group, Wisconsin, 1996.*

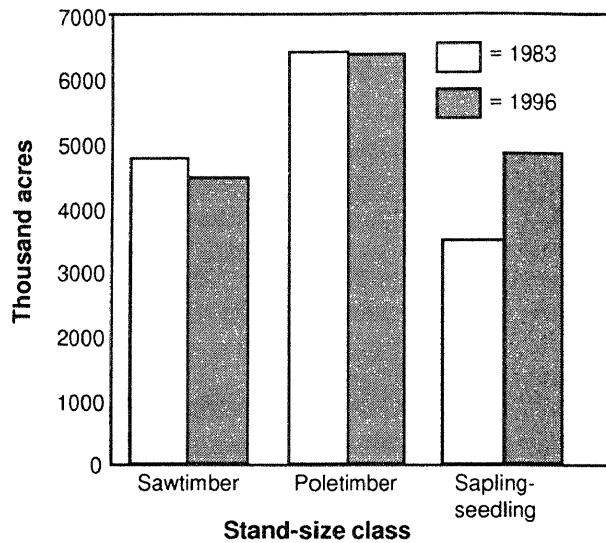

Figure 4.—*Area of timberland, by stand-size class, Wisconsin, 1983 and 1996.*

- Stocking, a measure of how occupied the land is by trees, improved between 1983 and 1996 in Wisconsin. For example, the percentage of poorly stocked timberland decreased from 24 percent of the total area of timberland in 1983 to only 14 percent in 1996. By 1996, more than 50 percent of the total area of timberland in Wisconsin was fully stocked, compared to 42 percent in 1983.

- The number of growing-stock trees in Wisconsin increased from about 7.3 billion in 1983 to 8.7 billion in 1996. With a statewide population of about 5.1 million people in 1996, Wisconsin had more than 1,700 growing-stock trees for each citizen in 1996.

- Quaking aspen, with almost 1.5 billion growing-stock trees, is currently the most abundant species in Wisconsin. Balsam fir, with more than 750 million growing-stock trees in 1996, is the most abundant conifer.
- Growing-stock volume increased from 16.5 billion cubic feet in 1983 to 18.5 billion cubic feet in 1996, reflecting the increase in both area and stocking during the 13 years between inventories.
- In both 1983 and 1996, hardwoods accounted for three-fourths of all growing-stock volume. The species groups with the most growing-stock volume in 1996 were aspen (quaking aspen and bigtooth aspen), 2.5 billion ft³; red oak (select red oak and other red oak), 2.4 billion ft³; hard maple, 2.2 billion ft³; and soft maple, 1.9 billion ft³ (fig. 5).

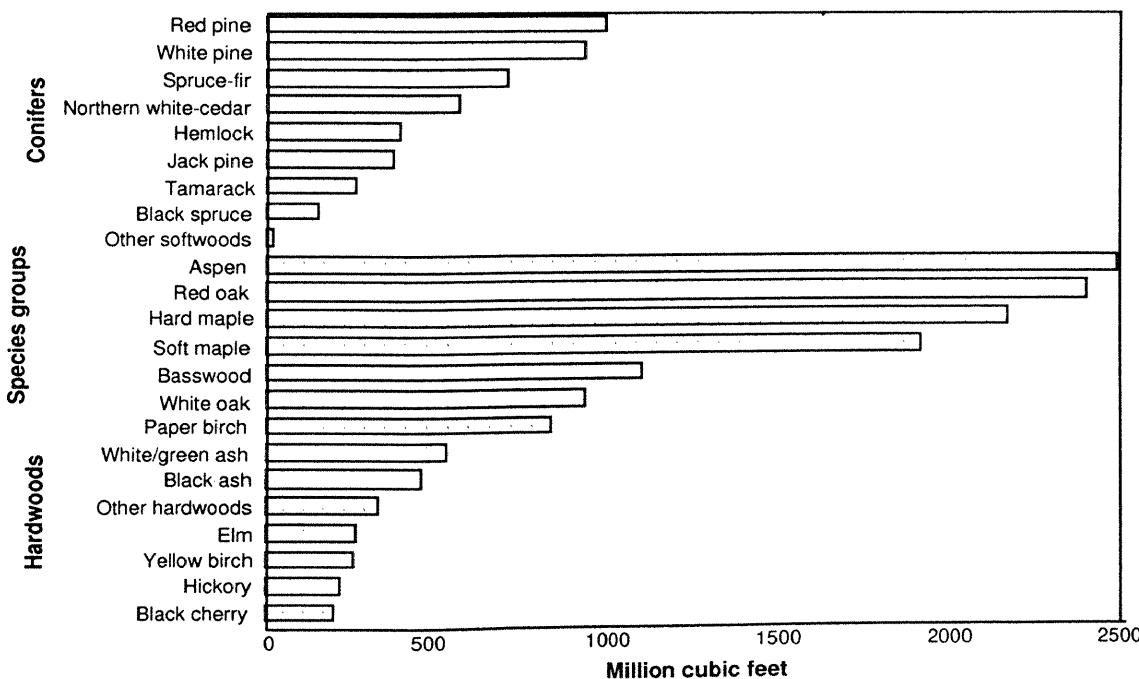

Figure 5.—*Growing-stock volume, by species group, Wisconsin, 1996.*

- While the total area of timberland typed as oak-hickory remained constant between inventories at about 2.9 million acres, growing-stock volumes for the oak and hickory species groups generally increased. For example, select white oak increased from 759 million ft³ to 927 million ft³ between 1983 and 1996, an increase of 22 percent.
- One of the more interesting changes in Wisconsin's forests between 1983 and 1996 is in the distribution of aspen growing stock. In 1983, 67 percent of the aspen growing-stock volume was in the aspen-birch forest type. By 1996, only 57 percent of the aspen growing-stock volume was in the aspen-birch forest type. Aspen is a pioneer species that generally does not reproduce itself in an established stand. Instead, aspen relies on disturbances to create an environment that is suitable for regeneration. Currently almost half of all aspen growing-stock volume is in other forest types, indicating that many of the aspen-birch forest types are in the process of converting to other forest types. As the established aspen matures and begins to die out, more shade-tolerant species become established, resulting in the stands being reclassified from aspen-birch to other forest types.
- While the area of timberland typed as white pine decreased from 224 thousand acres to 192 thousand acres, white pine growing-stock volume increased by almost 50 percent from 1983 (625 million ft³) to 1996 (929 million ft³). There is a considerable amount of white pine growing-stock volume in forest types other than white pine. More than 20 million ft³ of white pine growing-stock volume are in the red pine, oak-hickory, elm-ash-soft maple, maple-beech-birch, aspen, and paper birch forest types.
- From 1983 to 1996, total sawtimber volume in Wisconsin increased by 31 percent, rising from 37 billion board feet to 48 billion board feet. In both 1983 and 1996, red oak was the most prevalent hardwood sawtimber species and white pine was the most prevalent conifer sawtimber species.
- The quality of the sawtimber in Wisconsin has improved over recent inventories. As an example, the percentage of sawtimber in the highest quality classifications (grades 1 and 2) increased from 28 percent in 1983 to 40 percent in 1996 (fig. 6). The predominant reason for this improvement in quality is the increase in the overall size (diameters and lengths) of the sawtimber resource.

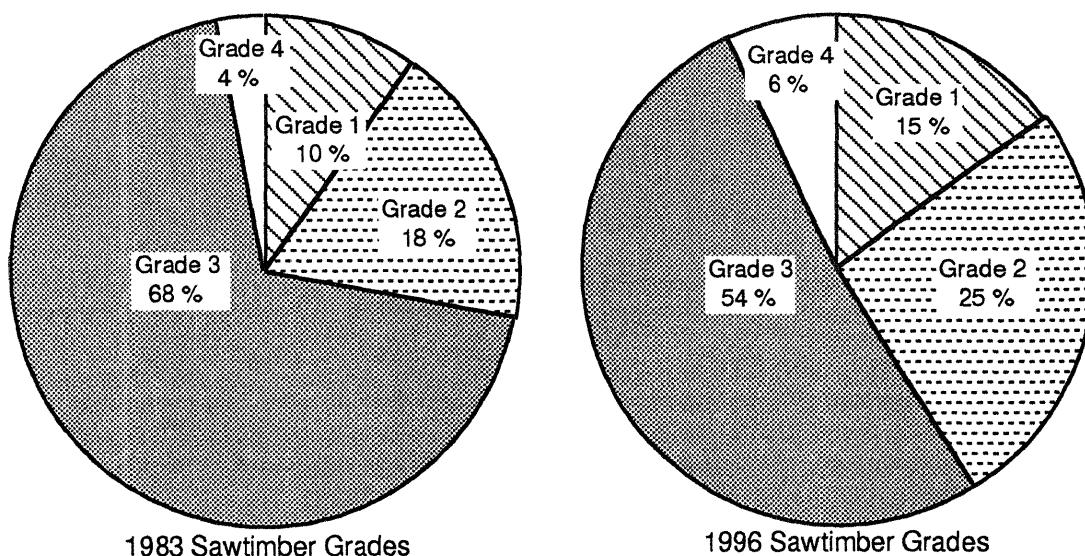

Figure 6.—Percent of sawtimber by grade, Wisconsin, 1983 and 1996.

- In 1996, 87 percent of the total volume on timberland in Wisconsin qualified as growing stock. Other sources of wood fiber volume in Wisconsin include short-log, rough, rotten, and salvable dead trees. Although the vast majority of wood harvested is from growing stock, these other sources of volume also contribute to the overall harvest and availability of wood fiber in Wisconsin.

Causes of Change in Wisconsin's Forests

- The primary causes of change in Wisconsin's forests are natural successional processes, growth, mortality, and other natural disturbances, as well as human-induced changes such as harvesting, other forest management activities, and land-use changes. These change factors often result in reclassifications from one forest type to another. For example, many timberland sites were classified as aspen forest type in 1983. However, when our field crews revisited these same sites in 1996, succession had progressed to where the aspen trees were replaced by more shade-tolerant hardwood species. As a result of these changes, the stand was reclassified as maple-beech-birch.
- Between 1983 and 1996, Wisconsin's average annual net growth of growing stock was 490 million ft³. This equates to an average annual net growth rate of 31 ft³ of growing stock per acre for each of the 15,702,500 acres of timberland in Wisconsin in 1996.
- Conifer species groups with the largest average annual net growth of growing stock between inventories were red and white pine. These two species groups alone accounted for 58 percent of the total average annual net growth of growing stock for all conifers in Wisconsin.
- Hardwood species groups with the largest average annual net growth of growing stock between inventories were aspen (bigtooth and quaking aspen), soft maple (red and silver maple), hard maple (black and sugar maple), and red oak (select and other red oak). All four of these species groups averaged more than 50 million ft³ of annual net growth of growing stock between 1983 and 1996.
- Wisconsin's average annual mortality of growing stock was 190 million ft³ between 1983 and 1996. This equates to an average annual mortality rate of 12 ft³ of growing stock per acre for each of the 15,702,500 acres of timberland in Wisconsin.
- Of the known causes of growing-stock mortality, stem decay, foliage diseases, and bole borers are the primary causes of mortality in Wisconsin. Other causes of growing-stock mortality include hypoxylon canker, oak wilt, Dutch elm disease, and flooding.
- Aspen mortality accounted for more than one-fourth of the total average annual mortality of growing stock in Wisconsin between 1983 and 1996. In addition, paper birch, red oak, balsam fir, and elm all had average annual mortality of growing stock rates of more than 10 million ft³ during this time period.
- Between 1983 and 1996, Wisconsin's average annual removals of growing stock were 332 million ft³. This equates to an average annual removal rate of 21 ft³ of growing stock per acre for each of the 15,702,500 acres of timberland in Wisconsin. This removal rate represents 1.8 percent of the total growing-stock volume in Wisconsin.
- The average annual removal rate for hardwood growing stock (279 million ft³) was 2.0 percent of the total hardwood growing-stock volume. Average annual removals of softwood growing stock were 53 million ft³, 1.2 percent of the total softwood growing-stock volume.
- Between 1983 and 1996, the primary softwood species groups (growing-stock removals) harvested in Wisconsin were jack pine, white pine, red pine, and balsam fir.
- Between 1983 and 1996, the primary hardwood species groups harvested (growing-stock removals) in Wisconsin were aspen (quaking and bigtooth aspen), red oak (select red oak and other red oak), hard maple (black and sugar maple), soft maple (red and silver maple), and paper birch.

Forest Habitat Types of Wisconsin

- The 1996 inventory of Wisconsin's forest resources included the use of the Wisconsin Forest Habitat Type Classification System (Kotar *et al.* 1988, Kotar and Burger 1996). The habitat type system is a method of site classification that uses floristic composition, particularly under-story species, as an indicator of biological site capability. Knowledge of the biological potential of forest sites can lead to improved management. For convenience, the 95 habitat types recognized in Wisconsin were grouped into 15 habitat type groups: 7 northern and 8 southern. The groups represent steps of the moisture-nutrient gradient for each of the two regions.
- In this inventory, the greatest acreages of forest land were classified as the North Mesic (2.3 million acres), North Wet-Mesic (2.2 million acres), and North Wet (2 million acres) habitat type group.
- Of the 95 habitat types identified, the greatest acreages of forest land are classified in the Lowland North, Hydromesic North, Lowland South, ArCi-Ph (*Acer/Circaeum-Phryma*), ATM (*Acer-Tsuga/Maianthemum*), AViO (*Acer/Viola-Osmorrhiza*), and TMC (*Tsuga/Maianthemum-Coptis*) habitat types. More than 400 thousand acres of forest land are found in each of these habitat types.
- Regarding the major species groups, pine is primarily represented by dry site habitat groups, other softwoods by mesic to wet site habitat groups, soft hardwoods by mesic to wet-mesic site habitat groups, and hard hardwoods by dry-mesic to mesic site habitat groups.

APPENDIX

ACCURACY OF THE SURVEY

Forest Inventory and Analysis information is based on a sampling procedure designed to provide reliable statistics at the State and Survey Unit levels. Consequently, the reported figures are estimates only. A measure of reliability of these figures is given by sampling errors. These sampling errors mean that the chances are two out of three that if a 100-percent inventory had been made, using the same methods, the results would have been within the limits indicated.

For example, the estimated growing-stock volume in the State in 1996, 18,473.2 million cubic feet, has a sampling error of ± 0.78 percent (± 144.1 million cubic feet). The growing-stock volume from a 100-percent inventory would be expected to fall between 18,329.1 million cubic feet and 18,617.3 million cubic feet ($18,473.2 \pm 144.1$), there being a one in three chance that this is not the case.

| Item | State totals | Sampling error |
|--|----------------------|----------------|
| Growing stock | (Million cubic feet) | (Percent) |
| Volume (1996) | 18,473.2 | 0.78 |
| Average annual growth (1983-1995) | 490.1 | 1.42 |
| Average annual removals (1983-1995) | 332.2 | 6.35 |
| Sawtimber | (Million board feet) | |
| Volume (1996) | 48,020.4 | 1.09 |
| Average annual growth (1983-1995) | 1,680.6 | 1.67 |
| Average annual removals (1983-1995) | 986.2 | 6.85 |
| | (Thousand acres) | |
| Timberland area (1996) | 15,702.5 | 0.28 |

As survey data are broken down into sections smaller than State totals, the sampling error increases. For example, the sampling error for timberland area in a particular county is higher than that for total timberland area in the State. To estimate sampling error for data smaller than State totals, use the following formula:

$$E = \frac{(SE) \sqrt{(\text{State total volume or area})}}{\sqrt{(\text{Volume or area smaller than State total})}}$$

Where :

E = Sampling error in percent.

SE = State total error for volume or area.

For example, to compute the error on the area of timberland in the maple-beech-birch type for the State, proceed as follows:

- 1) Total statewide area of maple-beech-birch type = 5,299.7 thousand acres.
 - 2) Total statewide area of all timberland = 15,702.5 thousand acres.
 - 3) The State total error for timberland area = 0.28 percent.
- 4) Using the above formula:
- $$E = \frac{0.0028 \sqrt{15,702.5}}{\sqrt{5,299.7}}$$
- E= 0.0048 or 0.48 percent sampling error for the maple-beech-birch forest type in Wisconsin.

County Data

A standard FIA inventory is designed to provide sampling errors of no more than 3 percent per million acres of timberland or an overall error on Wisconsin's nearly 15.7 million acres of about 0.7 percent. More accurate survey information was obtained during this survey than otherwise would have been feasible because sampling intensity was increased from a single intensity level to a double intensity level. The goal was to provide a sampling error of less than 10 percent for total timberland area by county from the increased sampling intensity. Such sampling was made possible through the cooperation, assistance, and additional funding provided by the State of Wisconsin. In addition, to aid in determining current timber removals, the Wisconsin Department of Natural Resources (WDNR) also surveyed primary wood-using plants in the

State. Sampling errors for area, volume, growth, and removals, for both growing stock and sawtimber, for each county in Wisconsin are shown in Appendix table 56.

The sampling error within a county depends on county size and total area of timberland. Many large, heavily forested counties in the State have sampling errors below 5 percent. However, in counties where timberland area is less than 35,000 acres, the sampling error for the total area in timberland will generally exceed 10 percent. The sampling error for total timber volume in a reporting area containing 35,000 acres of timberland will be about 20 percent.

COMPARING WISCONSIN'S FIFTH INVENTORY WITH THE FOURTH INVENTORY

A new volume estimation procedure developed for the Lake States was used to compute the 1996 volumes and to recompute the 1983 volume. Although the adjustment will differ by Survey Unit and species, the recomputed 1983 growing-stock and sawtimber volumes will generally be greater than those shown in the 1983 report.

Past surveys used only growing-stock trees to determine stand-size class. Current survey procedures require that stand-size class be determined on the basis of all live trees. Therefore, direct comparisons of current

inventory data to old inventory data by stand-size class may be misleading.

The basic building block for estimating forest area and timber volume has been changed from the Survey Unit to the county. In the past, the statistics were developed at the Unit level and prorated back to the county on the basis of photo-interpretation points. Direct development of county-level data helps users interested in more precise local data, but can make the data comparisons with past estimates misleading.

SURVEY PROCEDURES

The 1996 Wisconsin survey used a growth model-enhanced, two-phase sample design. Using this sampling scheme and associated estimators is similar to sampling with partial replacement, in that a set of randomly located plots is available for remeasurement and a random set of new plots is established and measured. A feature of the new Wisconsin design is stratification for disturbance on the old sample and use of a growth model to improve regression estimates made on old undisturbed forest plots (fig. 7). Detailed descriptions of the sampling and estimation procedures are presented by Hansen (1990). The growth model used in the Wisconsin survey design was the Lake States Stand and Tree Evaluation and Modeling System (STEMS) (Belcher *et al.* 1982).

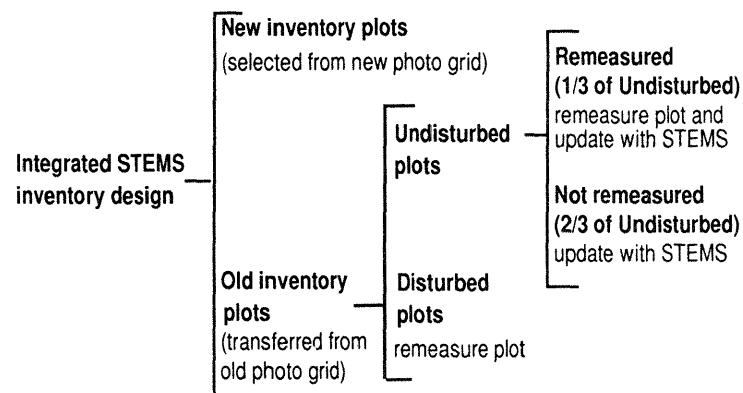

Figure 7.—Overview of the Wisconsin sample design.

Major Steps in the New Survey Design

1. Aerial photography (Phase 1)

In this phase, two sets of random points were located on current aerial photography. The first is a set of new photo plots and the second is a set of relocated old ground plot locations from the 1983 inventory. Aerial photographs, taken from 1991 through 1993, that were used for Phase 1 of the inventory were black and white, infra-red at a scale of 1:15,840 for the Northeast, Northwest, and Central Units and at a scale of 1:24,000 for the Southeast and Southwest Units. The WDNR contracted this photography and loaned the photos to the Forest Service. The locations of plots used in the 1983 inventory were transferred to these new photographs. The photographs were then assembled into township mosaics, and a systematic grid of 121 one-acre photo plots (each plot representing approximately 190.4 acres) was overlaid on each township mosaic. Each of these photo plots was examined by aerial photo interpretation specialists and classified stereoscopically based on land use. If trees were present, forest type and stand-size/density class were recorded. After this examination, all the old "disturbed" sample locations and one-third of the old "undisturbed" forested plots were sent to the field for survey crews to verify the photo classification and to take further measurements. All photo plot locations for the 1996 inventory were examined and were classified as shown in the tabulation below.

A systematic sample of the aerial photo plots were selected to become ground plots in phase 2 of the procedure. Ground plots that definitely were not forest land were given a nonforest ground land use classification and not sent to the field for measurement.

| Photo land class | Photo plots |
|-------------------------|--------------------|
| Forest land | 90,242 |
| Reserved forest land | 1,392 |
| Questionable | 1,230 |
| Nonforest with trees | 9,826 |
| Nonforest reserved | 337 |
| Nonforest without trees | 95,712 |
| Water | 4,587 |
| All classes | 203,326 |

2. Plot measurements (Phase 2)—

Overview of 1983 Plot Design

On plots classified as timberland, wooded pasture, or windbreak (at least 120 feet wide), a ground plot was established, remeasured, or modeled. Old plots sent to the field for remeasurement that could not be relocated were replaced with a new plot at the approximate location of the old one. Each ground plot consisted of a cluster of 10 subplots covering approximately 1 acre. At each subplot, trees 5.0 inches or more in d.b.h. were sampled on a 37.5 Basal Area Factor (BAF) variable-radius plot, and trees less than 5.0 inches d.b.h. were sampled on a 1/300-acre fixed-radius plot only at subplots 1, 2, and 3. The arrangement of the 10 subplots within the plot was adjusted if they were located in a land use that was different from subplot 1. Under the estimation procedures used in this inventory, the entire plot measurement represented a single land classification. Thus, if a subplot was located outside of the land classification for the plot, it was rotated into the land classification. For example, if subplots 1 through 9 were located in a forest land classification and subplot 10 fell in a pasture, subplot 10 was rotated back into the forest land classification.

Plot measurements (Phase 2)—

Overview of 1996 Plot Design

On plots classified as forest land (including reserved forest land, unproductive forest land, and timberland), wooded pasture, or wind-breaks (at least 120 feet wide), a ground plot was established, remeasured, or modeled. Locating ground plots on all forest lands represented a major change between the 1983 and 1996 inventories.

In 1996, the overall plot layout consisted of 10 subplots arranged in a cluster with 70 feet between clusters. The basic location of plots and subplots was the same as the 1983 plot layout. All trees less than 5 inches in d.b.h. were measured on a 6.8-foot radius (1/300th acre) circular microplot located at the center of each subplot. (In 1983, this microplot was measured only on subplots 1, 2, and 3). This radius was the maximum distance at which a 5-inch tree would be selected using a basal area factor (BAF) of 37.5 prism. Trees with diameters between 5 and 17 inches were

selected at each of the 10 subplots with a BAF of 37.5. Trees greater than 17 inches d.b.h. were selected from a 24-foot fixed radius macro-subplot centered at each of the 10 subplots. The macro subplots were mapped for forest conditions, and subplots were not rotated even if they fell into another condition. Factors that would determine a change in condition from subplot 1 were changes in forest type, stand size class, land use, and density. Each condition that occurred anywhere on one of the subplots was identified, described, and mapped. Each condition was assigned a condition number, and condition information was recorded.

On remeasurement plots, the rotated subplots and all the trees measured on the 1983 plot design were also measured to obtain change data such as growth and mortality. On new plots, subplots were not rotated. Hahn *et al.* (1995) presents further in-depth procedures.

a) New inventory plots

A systematic sample of the new photo plots was selected for field measurement. Ground plots were established, and measures of current classification such as land use, forest type, and ownership as well as size and condition of all trees on the plot were recorded. These locations were monumented for future remeasurement.

b) Old inventory plots

These plots were established, monumented, and measured as part of the 1983 field inventory. The procedures for these old plots were different from those for the new plots. Old plots were classed as "undisturbed" or "disturbed" in the aerial photo phase of the sampling process. All disturbed plots and a one-third sample of the undisturbed plots were remeasured to obtain estimates of current condition and changes since the last inventory. All trees measured on these plots in 1983 were remeasured or otherwise accounted for, and all new trees were identified and measured.

All sample plots that were timberland at the time of the 1983 inventory and determined to be undisturbed until the 1996 inventory were projected to the current time using STEMS. This procedure gives projected estimates of current volume and growth for these undisturbed plots. The comparison of the projected and observed values on the one-third sample of the undisturbed forest plots that were remeasured provided local calibration data to adjust the projected values of the undisturbed plots that were not remeasured. The adjustment procedure is a modified version of the method described by Smith (1983).

The undisturbed timberland plots that were not remeasured play a crucial role in the new survey design. These plots were determined to be undisturbed and had conditions that could be simulated by STEMS. The STEMS growth model was used to "grow" the old plot and tree data to produce an estimate of current data. Thus, these plots were treated as ground plots, even though they were never visited. The plot record for each modeled plot was sent to the field for verification of current ownership information.

All old plots classified as disturbed were sent to the field for remeasurement to assess and verify changes since the last inventory. Disturbance refers to any change on a plot that can be detected on aerial photos and that the STEMS growth processor cannot predict, such as catastrophic mortality, cutting, regenerating stands, and land use change.

The estimation procedure for computing statistics from this sampling design was more complicated than the simple two-phase estimation procedure used in the past. In fact, this procedure yielded two independent samples, one coming from the new photo points and the other coming from the old photo points that are remeasured or modeled. The tabulation on the next page summarizes the distribution of all ground plots for the new inventory design by type of plot:

| Ground land use class | Old plots remeasured | Old plots updated | New plots | Total plots |
|----------------------------------|---------------------------------|------------------------------|----------------------|------------------------|
| Timberland | 2,589 | 449 | 6,127 | 9,165 |
| Reserved forest land | 72 | 0 | 73 | 145 |
| Other forest land | 15 | 0 | 10 | 25 |
| Nonforest with trees | 276 | 25 | 697 | 998 |
| Nonforest without trees | 2,348 | 205 | 7,370 | 9,923 |
| Water | 166 | 41 | 477 | 684 |
| Total | 5,466 | 720 | 14,754 | 20,940 |

3. Area estimates

Area estimates were made using two-phase estimation methods. In this type of estimation, a preliminary estimate of area by land use is made from the aerial photographs (Phase 1) and corrected by the plot measurements (Phase 2). A complete description of this estimation method is presented by Loetsch and Haller (1964).

4. Volume estimates

Estimates of volume per acre were made from the trees measured or modeled on the 10-point plots. Estimates of volume per acre were multiplied by the area estimates to obtain estimates of total volume. Net cubic foot volumes are based on a modification of the method presented by Hahn (1984) for use in the Lake States. For the Wisconsin inventory, the merchantable height equation presented in Hahn (1984) was used in conjunction with Stone's equation (see Appendix I in Hahn 1984) to estimate gross volume. This estimate was then corrected by species for variation in bark and cull volume to yield an estimate of net volume, using the coefficients presented in Hahn (1984).

The Forest Service reports all board foot volume in International 1/4-inch rule. In Wisconsin, the Scribner log rule is commonly used. Scribner log rule conversion factors were derived from full tree measurements taken throughout the Lake States (Michigan, Wisconsin, and Minnesota) and an equation developed by Wiant and Castenaeda (1977). The factors (multipliers) used to convert board foot International volumes to the Scribner rule are shown in the following tabulation:

| D.b.h. (inches) | Scribner rule conversion factor | |
|----------------------------|--|------------------|
| | Softwoods | Hardwoods |
| 9.0-10.9 | 0.7830 | — |
| 11.0-12.9 | .8287 | 0.8317 |
| 13.0-14.9 | .8577 | .8611 |
| 15.0-16.9 | .8784 | .8827 |
| 17.0-18.9 | .8945 | .8999 |
| 19.0-20.9 | .9079 | .9132 |
| 21.0-22.9 | .9168 | .9239 |
| 23.0-24.9 | .9240 | .9325 |
| 25.0-26.9 | .9299 | .9396 |
| 27.0-28.9 | .9321 | .9454 |
| 29.0+ | .9357 | .9544 |

5. Growth and mortality estimates

On remeasured plots, estimates of growth and mortality per acre come from the remeasured diameters of trees and from observation of trees that died between inventories. These estimates are based on the remeasurement of the 1983 inventory plots using the 1983 plot design. Growth reported as the average net annual growth between the two inventories (1983 and 1996) is computed from data on remeasured plots and modeled plots using methods presented by VanDeusen *et al.* (1986). Mortality is also average net annual for the remeasurement period. On new plots, estimates of growth and mortality were obtained by using STEMS to project the growth and mortality of trees for 1 year. Growth and mortality estimates for old undisturbed plots that were updated were derived in the same manner as remeasured plots. The STEMS growth model was adjusted by Survey Unit to meet local conditions, using data from the undisturbed remeasurement plots. As with volume, total growth and mortality estimates were obtained by multiplying the per acre estimates by area estimates. Current annual growth for 1995 was computed by using the adjusted STEMS model to grow all current inventory plots for 1 year.

6. Average annual removals estimates

Average annual growing-stock and sawtimber removals (1983 to 1995) were estimated only from the remeasured plots; (These estimates are based on the remeasurement of the 1983 inventory plots using the 1983 plot design) new plots and STEMS-projected plots were not used to estimate removals. These estimates are obtained from trees measured in the last survey and cut or otherwise removed from the timberland base. Because remeasurement plots make up about one-half of the total ground plots and not all remeasurement plots had cutting, average annual removals estimates have greater sampling errors than volume and growth estimates.

HABITAT TYPE CLASSIFICATION OF WISCONSIN

The 1996 inventory of Wisconsin's forest resources included the use of the Wisconsin Forest Habitat Type Classification System (Kotar *et al.* 1988, Kotar and Burger 1996). The habitat type groups are described as:

Habitat Type Groups - North

1. North, very dry to dry

This group represents the driest, least fertile soils of the region. Forests are dominated by pines (primarily jack and red pine) and poor quality oak. Red maple is the most shade tolerant species found on these sites and can replace other species in the absence of natural disturbance or management.

2. North, dry to dry-mesic

This group is a step up on the soil moisture-nutrient gradient from the preceding group. In addition to jack and red pines, white pine and red oak also thrive on these types. White pine is sufficiently shade tolerant to reproduce naturally in mixed stands of oaks, aspen, red maple and other pines.

3. North, dry-mesic

Soil moisture and nutrients are adequate to support shade tolerant, mesic species such as sugar maple, basswood and white ash, but not at their optimal levels. Following natural disturbance or logging, red oak, red maple, or white pine often assume dominance in the stand. However, without natural disturbance or management, stands on these types tend to succeed to mesic hardwoods.

4. North, mesic

This group represents the best soil moisture-nutrient condition in the region. Shade tolerant, mesic hardwoods (sugar maple, basswood, white ash, American beech) or hemlock dominate most stands. Less shade tolerant species gain temporary dominance only following a major disturbance, especially by fire. However, fires are not frequent on these habitat types.

5. North, wet-mesic

This group represents a transition from upland to lowland forest. Sites with higher nutrient levels are dominated by mesic hardwoods (e.g. sugar maple, basswood, white ash) and sites with lower nutrient levels by hemlock, white pine or balsam fir. Aspen or red maple often dominate successional stands on all habitat types of this group.

6. North, wet

These are distinctly lowland sites. No specific habitat types were identified. Forests are dominated by swamp conifers (e.g. northern white-cedar, black spruce, balsam fir) or by red maple, black ash, or aspen.

7. North, boreal

The two habitat types in this group represent a special case where clayey soils and climate, modified by Lake Superior, historically supported upland forests dominated by balsam fir. Most of these sites are currently occupied by quaking aspen, but succession to balsam fir is evident.

Habitat Type Groups - South

8. South, dry

These types represent the driest, sandy soils primarily in central and western parts of the State. Jack pine, red pine, white pine, oaks, and/or aspen comprise most of the stands. Communities are similar to those of northern dry habitat types, but often include white oak, black oak, and bur oak in addition to red and pin oaks. Red oak typically does not attain merchantable size.

9. South, dry-mesic

These habitat types represent better growth conditions for all species of oak as well as pine. Red maple also competes more strongly on these habitat types compared to those of the preceding group. In the absence of natural

disturbance or management, red maple is capable of replacing most other species. Sugar maple is absent.

10. South, dry-mesic to mesic

The soil moisture and nutrient levels on these habitat types are adequate to support moderate growth of mesic hardwoods such as sugar maple and basswood. Red and white oaks grow well on these types and comprise the largest volume in present stands. However, in the absence of management, they tend to be replaced by mesic hardwoods.

11. South, dry-mesic to mesic (phase)

These types represent similar soil conditions as those of the preceding group, but have experienced a more intense fire disturbance regime in the pre-settlement time. As a result, mesic hardwoods have been virtually eliminated from the landscape and are not currently replacing oaks or other intolerant species. For these reasons, oak regeneration is relatively easy to achieve.

12. South, mesic

This group represents mesic, nutrient rich sites that experienced relatively little fire disturbance in presettlement time and continue to be dominated by sugar maple, basswood and white ash. Lack of natural disturbance, or management by light partial cutting, favors sugar maple dominance.

13. South, mesic (phase)

These habitat types occupy similar soils as those of the preceding group, but experienced a more intense fire disturbance regime in presettlement time. As a result, stands are dominated by various shade-intolerant species and mesic hardwoods are absent.

14. South, wet-mesic

This group represents poorly drained mineral soils. No specific habitat types have been identified. Best adapted species appear to be red maple and black ash, but many other species occur.

15. South, wet

This group represents swampy or boggy conditions with either mineral or organic soils. No specific habitat types have been identified. Best adapted species are black ash, red maple and white pine on mineral soils; and tamarack, black spruce and white cedar on organic soils.

16. No habitat type group identified

No habitat type group was identified on the field plot.

In addition to the 16 habitat type groups, 96 specific habitat types were used in the 1996 inventory of Wisconsin's forest resources. A brief list of those species associated with each habitat type follows.

16. No type identified

No habitat type was identified on the plot location.

TREE AND LOG GRADES

Log grades and tree grades are based on the classification of external characteristics as indicators of quality. Log grades and/or tree grades were taken on approximately one-third of the sample plots in Wisconsin. All sawtimber softwood sample trees were graded for quality and assigned a butt log grade. All sawtimber hardwood sample trees were graded for quality and assigned a tree grade. The volume yield by log grade or tree grade for this sample was used to distribute the volume of the ungraded sample trees by species group.

Hardwood sawtimber trees were graded according to "Hardwood Tree Grades for Factory Lumber" (Hanks 1976). The best 12-foot

section of the lowest 16-foot hardwood log was used for grading. Hardwood sawtimber trees that did not meet minimum tree grade specifications for grades 1 through 3 were assigned grade 4 according to Forest Service standard specifications for hardwood construction logs described in "A Guide to Hardwood Log Grading" (Rast *et al.* 1973).

Red pine and jack pine sawtimber trees were graded based on specifications described in "Forest Service Log Grades for Southern Pines" (Campbell 1964). White pine and other softwood sawtimber trees were graded according to specifications described by Ostrander and Brisbin (1971). For all softwoods, the first merchantable 16-foot log, or shorter lengths down to 12 feet, was used for grading.

Hardwood Tree Grade for Factory Lumber ^a

| Grade factor | Tree grade 1 | Tree grade 2 | Tree grade 3 |
|--|-----------------------|---------------------|---------------------|
| Length of grading zone (feet) | Butt 16 | Butt 16 | Butt 16 |
| Length of grading section ^b (feet) | Best 12 | Best 12 | Best 12 |
| D.b.h., minimum (inches) | 16 ^c | 13 | 11 |
| D.i.b., minimum at top of grading section (inches) | 13 ^c 16 20 | 11 ^d 12 | 8 |
| Clear cuttings (on the 3 best faces) ^e | | | |
| Length, minimum (feet) | 7 5 3 | 3 3 | 2 |
| Number on face (maximum) | 2 | 2 3 | Unlimited |
| Yield in face length (minimum) | 5/6 | 4/6 | 3/6 |
| Cull deduction (including crook and sweep, but excluding shake) maximum within grading section (percent) | 9 | f | 50 |

^a Hanks (1976)

^b Whenever a 14- or 16-foot section of the butt 16-foot log is better than the best 12-foot section, the grade of the longer section will become the grade of the tree. This longer section, when used, is the basis for determining the grading factors such as diameter and cull deduction.

^c In basswood and ash, d.i.b. at top of grading section must be 12 inches and d.b.h. must be 15 inches.

^d Grade 2 trees can be 10 inches d.i.b. at top of grading section if they otherwise meet surface requirements for small grade 1's.

^e A clear cutting is a portion of a face free of defects, extending the width of the face. A face is one-fourth of the surface of the grading section as divided lengthwise.

^f Fifteen percent crook and sweep or 40 percent total cull deduction are permitted in grade 2 trees, if size and surface of grading section qualify as grade 1. If rot shortens the required

**Forest Service Standard Specifications for Hardwood
Construction Logs (tie and timber logs) ^{a, b}**

| | |
|-----------------------------|--|
| <u>Position in tree</u> | <u>Butts and uppers</u> |
| Minimum diameter, small end | 8 inches |
| Minimum length without trim | 8 feet |
| Clear cuttings | No requirements |
| Sweep allowance | One-fourth of the diameter at the small end for each 8 feet of length. |
| Sound surface defects: | |
| Single knots | Any number, if no one knot has an average diameter above the callus in excess of one-third of the log diameter at point of occurrence. |
| Whorled knots | Any number, if the sum of knot diameters above the callus does not exceed one-third of the log diameter at point of occurrence. |
| Holes | Any number, provided none has a diameter over one-third of the log diameter at point of occurrence and none extends more than 3 inches into included timber ^c . |
| Unsound surface defects: | Same requirements as for sound defects if they extend into included timber. No limit if they do not. Logs must be sound internally. |

^a Rast *et al.* (1973).

^b These specifications are minimum for the class. If, from a group of logs, factory logs are selected first, thus leaving only nonfactory logs from which to select construction logs, then the quality range of the construction logs so selected is limited, and the class may be considered a grade. If selection for construction logs is given first priority, it may be necessary to subdivide the class into grades.

^c Included timber is always square, and dimension is judged from small end.

Eastern White Pine Saw log Grade Specifications ^a

| Grading factor | Log grade 1 | Log grade 2 | Log grade 3 | Log grade 4 |
|--|--|--|---|--|
| 1. Minimum scaling diameter (inches) | 14 ^b | 6 | 6 | 6 |
| 2. Minimum log length (feet) | 10 ^c | 8 | 8 | 8 |
| 3. Maximum weevil injury (number) | None | None | 2 injuries ^d | No limit |
| 4. Minimum face requirements | Two full length or four 50% ^e length good faces (in addition, log knots on balance of faces shall not exceed size limit of grade 2 logs). | NO GOOD FACES REQUIRED Maximum diameter of log knots on three best faces: SOUND RED KNOTS not to exceed 1/6 scaling diameter and 3" maximum OVERGROWN/DEAD/BLACK KNOTS not to exceed 1/12 scaling diameter and 1 1/2" max. | not to exceed 1/3 scaling diameter and 5" maximum not to exceed 1/6 scaling diameter and 2 1/2" max. | Includes all logs not qualifying for No. 3 or better and having at least 1/3 of their gross volume in sound wood suitable for manufacture into standard lumber |
| 5. Maximum sweep or crook (%) | 20 | 30 | 40 | 66 2/3 |
| 6. Maximum total scaling deduction (%) | 50 | 50 | 50 | 66 2/3 |

After the tentative grade is established from face examination, the grade will be reduced whenever the following defects are evident:

- 7. Conks, punk knots, and pine borer damage on bark surface. ^f
 Degrade one grade if present on one face.
 Degrade two grades if present on two faces.
Degrade three grades if present on three or more faces.
- 8. Log end defects: red rot, ring shake, heavy stain, and pine borer damage outside the heart center of log. ^f Consider log as having a total of 8 quarters (4 on each end) and degrade as indicated.
 Degrade one grade if present in 2 quarters of log ends.
 Degrade two grades if present in 3 or 4 quarters of log ends.
Degrade three grades if present in 5 or more quarters of log ends.

- a. Ostrander and Brisbin (1971)
- b. 12- and 13-inch logs with four full-length good faces are acceptable.
- c. 8-foot logs with four full-length good faces are acceptable.
- d. 8-foot Number 3 logs limited to one weevil injury.
- e. Minimum 50% length good face must be at least 6 feet.
- f. Factors 7 and 8 are not cumulative (total degrade based on more serious of the two). No log is to be degraded below grade 4 if net scale is at least one-third of gross scale.

Log Grades for Jack Pine and Red Pine ^a

Grade 1: Trees with three or four clear faces on the 16-foot grading section.^b

Grade 2: Trees with one or two clear faces on the 16-foot grading section.

Grade 3: Trees with no clear faces on the 16-foot grading section.

After the tentative grade is established from above, the tree will be reduced one grade for each of the following, except that no tree can be reduced below grade 3, provided the total scaling deductions for sweep and/or rot do not exceed two-thirds of the gross scale of the tree.

Sweep. Degrade any tentative grade 1 or 2 tree one grade if sweep in the lower 12 feet of grading sections amounts to 3 or more inches and equals or exceeds one-fourth of the diameter at breast height.

Heart rot. Degrade any tentative grade 1 or 2 tree one grade if conk, punk knots, massed hyphae, or other evidence of advanced heart rot is found anywhere on the main tree stem.

^a Campbell (1964)

^b A face is one-fourth of the circumference in width extending full length of the grading section. Clear faces are those free of: knots measuring more than 1/2-inch in diameter, overgrown knots of any size, and holes more than 1/4-inch in diameter. Faces may be rotated to obtain the maximum number of clear on the grading section.

Log Grades for All Other Softwood Logs

Grade 1

1. Trees must be 16 inches in diameter or larger, grading section 12 feet in length or longer, and with deduction for defect not over 30 percent of gross scale.
2. Trees must be at least 75 percent clear on each of three faces.
3. All knots outside clear cutting must be sound and not more than 2-1/2 inches in size.

Grade 2

1. Trees must be 12 inches in diameter or larger, grading section 12 feet in length or longer, and with a net scale after deduction for defect of at least 50 percent of the gross scale deducted for defect.
2. Trees must be at least 50 percent clear on each of three faces or 75 percent clear on two faces.

Grade 3

1. Trees must be 6 inches in diameter or larger, grading section 12 feet in length or longer, and with a net scale after deduction for defect of at least 50 percent of the gross contents of the log.

Note: Diameters are diameter inside bark (d.i.b.) at small end of grading section.

Percent clear refers to percent clear in one continuous section.

METRIC EQUIVALENTS

1 acre = 4,046.86 square meters or 0.405 hectare.
 1,000 acres = 405 hectares.
 1 cubic foot = 0.0283 cubic meter.
 1 foot = 30.48 centimeters or 0.3048 meter.
 1 inch = 25.4 millimeters, 2.54 centimeters, or 0.0254 meter.
 1 pound = 0.454 kilograms.
 1 ton = 0.907 metric tons.

TREE SPECIES GROUPS IN WISCONSIN (Little 1981)

SOFTWOODS²

Balsam fir *Abies balsamea*
 Eastern redcedar *Juniperus virginiana*
 Tamarack *Larix laricina*
 White spruce *Picea glauca*
 Black spruce *P. mariana*
 Eastern white pine *Pinus strobus*
 Red pine *P. resinosa*
 Jack pine *P. banksiana*
 Northern white-cedar *Thuja occidentalis*
 Eastern hemlock *Tsuga canadensis*
 Other softwoods
 European larch *Larix decidua*
 Norway spruce *Picea abies*
 Colorado (blue) spruce *P. pungens*
 Scotch pine *P. sylvestris*

HARDWOODS

Hard maples¹
 Black maple *Acer nigrum*
 Sugar maple *A. saccharum*
 Soft maples²
 Red maple *A. rubrum*
 Silver maple *A. saccharinum*
 Birches
 Yellow birch¹ *Betula alleghaniensis*
 River birch² *B. nigra*
 Paper birch² *B. papyrifera*
 Select hickories¹
 Shagbark hickory *Carya ovata*
 Other hickories¹
 Bitternut hickory *C. cordiformis*
 Hackberry² *Celtis occidentalis*
 American beech¹ *Fagus grandifolia*
 Ashes
 White ash¹ *Fraxinus americana*
 Black ash² *F. nigra*
 Green ash¹ *F. pennsylvanica*
 Butternut² *Juglans cinerea*
 Black walnut¹ *Juglans nigra*

Balsam poplar² *Populus balsamifera*
 Eastern cottonwood² *P. deltoides*
 Aspens²
 Bigtooth aspen *P. grandidentata*
 Quaking aspen *P. tremuloides*
 Black cherry² *Prunus serotina*
 Select white oaks¹
 White oak *Quercus alba*
 Swamp white oak *Q. bicolor*
 Bur oak *Q. macrocarpa*
 Chinkapin oak *Q. muehlenbergii*
 Select red oak¹
 Northern red oak *Q. rubra*
 Other red oaks¹
 Northern pin oak *Q. ellipsoidalis*
 Black oak *Q. velutina*
 Black willow² *Salix nigra*
 American basswood² *Tilia americana*
 Elms
 American elm² *Ulmus americana*
 Siberian elm² *U. pumila*
 Slippery elm² *U. rubra*
 Rock elm¹ *U. thomasii*
 Other hardwoods
 Boxelder² *Acer negundo*
 Northern catalpa² *Catalpa speciosa*
 Honeylocust¹ *Gleditsia triacanthos*
 Red mulberry² *Morus rubra*
 Black tupelo² *Nyssa sylvatica*
 var. *sylvatica*
 White poplar² *Populus alba*
 Black locust¹ *Robinia pseudoacacia*
 Noncommercial species
 Striped maple *Acer pensylvanicum*
 Mountain maple *A. spicatum*
 Ailanthus *Ailanthus altissima*
 American hornbeam *Carpinus caroliniana*
 Flowering dogwood *Cornus florida*
 Hawthorn *Crataegus* spp.
 Osage-orange *Maclura pomifera*
 Apple *Malus* spp.
 Eastern hophornbeam *Ostrya virginiana*
 Pincherry *Prunus pensylvanica*
 Wild plum *Prunus* spp.
 Chokecherry *P. virginiana*
 Peachleaf willow *Salix amygdaloides*
 Diamond willow *S. bebbiana*
 American mountain ash *Sorbus americana*

¹ This species or species group is considered a hard hardwood, with an average specific gravity greater than or equal to 0.50.

² This species or species group is considered a soft hardwood, with an average specific gravity of less than 0.50.

DEFINITION OF TERMS

Average annual mortality of growing stock.—The average cubic foot volume of sound wood in growing-stock trees that died in one year. Average annual mortality is the average for the years between inventories (1983 to 1995 in this report).

Average annual mortality of sawtimber.—The average board foot volume of sound wood in sawtimber trees that died in one year. Average annual mortality is the average for the years between inventories (1983 to 1995 in this report).

Average annual removals from growing stock.—The average net growing-stock volume in growing-stock trees removed annually for roundwood forest products, in addition to the volume of logging residues, and the volume of other removals. Average annual removals of growing stock are the average for the years between inventories (1983 to 1995 in this report) and are based on information obtained from remeasurement plots (see Survey Procedures in Appendix).

Average annual removals from sawtimber.—The average net board foot sawtimber volume of live sawtimber trees removed annually for roundwood forest products, in addition to the volume of logging residues, and the volume of other removals. Average annual removals of sawtimber are the average for the years between inventories (1983 to 1995 in this report) and are based on information obtained from remeasurement plots (see Survey Procedures in Appendix).

Average net annual growth of growing stock.—The annual change in cubic foot volume of sound wood in live sawtimber and poletimber trees, and the total volume of trees entering these classes through ingrowth, less volume losses resulting from natural causes. Average net annual growing stock is the average for the years between inventories (1983 to 1995 in this report).

Average net annual growth of sawtimber.—The annual change in the board foot volume of live sawtimber trees, and the total volume of trees reaching sawtimber size, less volume losses resulting from natural causes. Average net annual growth of sawtimber is the

average for the years between inventories (1983 to 1995 in this report).

Basal area.—Tree area in square feet of the cross section at breast height of a single tree. When the basal areas of all trees in a stand are summed, the result is usually expressed as square feet of basal area per acre.

Biomass.—The aboveground volume of all live trees (including bark but excluding foliage) reported in green tons (i.e., green weight). Biomass has four components:

Bole.—Biomass of a tree from 1 foot above the ground to a 4-inch top outside bark.

Tops and limbs.—Total biomass of tree from a 1-foot stump minus the bole.

1- to 5-inch trees.—Total aboveground biomass of a tree from 1 to 5 inches in diameter at breast height.

Stump.—Biomass of a tree 5 inches d.b.h. and larger from the ground to a height of 1 foot.

Bolts.—Roundwood logs of less than 8 feet in length that are converted into shingles, cooperage stock, dimension stock, blocks, blanks, excelsior, etc. No minimum diameter limits. Does not include logs used for the manufacture of pulp or veneer.

Commercial species.—Tree species presently or prospectively suitable for industrial wood products. (Note: Excludes species of typically small size, poor form, or inferior quality such as hophornbeam, Osage-orange, and redbud.)

Cord.—One standard cord is 128 cubic feet of stacked wood, including bark and air space. Cubic feet can be converted to solid wood standard cords by dividing by 79.

Corporate.—Lands owned by a private corporation not in the business of operating primary wood-using plants.

County and municipal land.—Land owned by counties and local public agencies or municipalities, or land leased to these governmental units for 50 years or more.

Cropland.—Land under cultivation within the last 24 months; including cropland harvested, crop failures, cultivated summer fallow, idle cropland used only for pasture,

orchards, active Christmas tree plantations indicated by annual shearing, nurseries, and land in soil improvement crops, but excluding land cultivated in developing improved pasture.

Cull.—Portions of a tree that are unusable for industrial wood products because of rot, missing or dead material, form, or other defect.

Current annual net growth of growing stock.—The annual change in volume of sound wood in live sawtimber and poletimber trees, and the total volume of trees entering these classes through ingrowth, less volume losses resulting from natural causes, reported for a single year (1995 in this report). Current growth is based on an estimate of the current annual increment of each growing-stock tree in the inventory.

Current annual net growth of sawtimber.—The annual change in the volume of live sawtimber trees, and the total volume of trees reaching sawtimber size, less volume losses resulting from natural causes, reported for a single year (1995 in this report). Current growth is based on an estimate of the current annual increment of each growing-stock tree in the inventory.

Current annual removals from growing stock.—The current net growing-stock volume in growing-stock trees removed annually for roundwood forest products, in addition to the volume of logging residues, and the volume of other removals. Current annual removals of growing stock are reported for a single year (1995 in this report); they are based on a survey of primary wood processing mills to determine removals for products and on information from remeasurement plots (see Survey Procedures in Appendix) to determine removals due to land use change.

Current annual removals from sawtimber.—The current net board foot sawtimber volume of live sawtimber trees removed annually for roundwood forest products, in addition to the volume of logging residues, and the volume of other removals. Current annual removals of sawtimber are reported for a

single year (1995 in this report); they are based on a survey of primary wood processing mills to determine removals for products and on information from remeasurement plots (see Survey Procedures in Appendix) to determine removals due to land use change.

Diameter class.—A classification of trees based on diameter outside bark, measured at breast height 4.5 feet above the ground. (Note d.b.h. is the common abbreviation for diameter at breast height.) Two-inch diameter classes are commonly used in Forest Inventory and Analysis, with the even inch the approximate midpoint for a class. For example, the 6-inch class includes trees 5.0 through 6.9 inches d.b.h.

Diameter at breast height (d.b.h.).—The outside bark diameter at 4.5 feet (1.37 m) above the forest floor on the uphill side of the tree. For determining breast height, the forest floor includes the duff layer that may be present, but does not include unincorporated woody debris that may rise above the ground line.

Forest industry land.—Land owned by companies or individuals operating primary wood-using plants.

Forest land.—Land at least 16.7 percent stocked by forest trees of any size, or formerly having had such tree cover, and not currently developed for nonforest use. (Note: Stocking is measured by comparing specified standards with basal area and/or number of trees, age or size, and spacing.) The minimum area for classification of forest land is 1 acre. Roadside, streamside, and shelterbelt strips of timber must have a crown width of at least 120 feet to qualify as forest land. Unimproved roads and trails, streams, or other bodies of water or clearings in forest areas shall be classed as forest if less than 120 feet wide. (See Tree, Land, Timberland, Reserved forest land, Other forest land, Stocking, and Water.)

Forest type.—A classification of forest land based on the species forming a plurality of live tree stocking. The associated species for each forest type are based on net volume of growing stock and all live biomass by species group. Major forest types in the State are:

Jack pine.—Forests in which jack pine comprises a plurality of the stocking. Species commonly associated with the jack pine forest type in Wisconsin include red pine, red oaks, aspen, and eastern white pine.

Red pine.—Forests in which red pine comprises a plurality of the stocking. Species commonly associated with the red pine forest type in Wisconsin include eastern white pine, jack pine, and aspen.

Eastern white pine.—Forests in which eastern white pine comprises a plurality of the stocking. Species commonly associated with the eastern white pine forest type in Wisconsin include red pine, aspen, red maple, paper birch, and red oak.

Balsam fir.—Forests in which balsam fir and white spruce comprise a plurality of stocking, with balsam fir the most common. Species commonly associated with the balsam fir forest type in Wisconsin include white spruce, aspen, northern white-cedar, tamarack, paper birch, red maple, black spruce, and eastern white pine.

White spruce.—Forests in which white spruce and balsam fir comprise a plurality of the stocking, with white spruce the most common. Species commonly associated with the white spruce forest type in Wisconsin include aspen, paper birch, balsam fir, eastern white pine, red maple, and northern white-cedar.

Black spruce.—Forests in which swamp conifers comprise a plurality of the stocking, with black spruce the most common. Species commonly associated with the black spruce forest type in Wisconsin include tamarack, balsam fir, eastern white pine, northern white-cedar, aspen, jack pine, and paper birch.

Northern white-cedar.—Forests in which swamp conifers comprise a plurality of the stocking, with northern white-cedar the most common. Species commonly associated with the northern white-cedar forest type in Wisconsin include balsam fir, paper birch, black spruce, tamarack, black ash, red maple, and aspen.

Tamarack.—Forests in which swamp conifers comprise a plurality of the stocking, with tamarack the most common. Species commonly associated with the tamarack forest type in Wisconsin include northern white-cedar, black spruce, red maple, white pine, balsam fir, and paper birch.

Oak-hickory.—Forests in which northern red oak, white oak, bur oak, or hickories, singly or in combination, comprise a plurality of the stocking. Species commonly associated with the oak-hickory forest type in Wisconsin include red maple, aspen, and black cherry.

Elm-ash-soft maple.—Forests in which lowland elm, ash, red maple, silver maple, and cottonwood, singly or in combination, comprise a plurality of the stocking. Species commonly associated with the elm-ash-soft maple forest type in Wisconsin include northern white-cedar, aspen, cottonwood, and balsam fir.

Maple-beech-birch.—Forests in which sugar maple, yellow birch, American elm, and red maple, singly or in combination, comprise a plurality of the stocking. Species commonly associated with the maple-beech-birch forest type in Wisconsin include basswood, eastern hemlock, green and white ash, aspen, black cherry, and select red oaks.

Aspen.—Forests in which quaking aspen or bigtooth aspen, singly or in combination, comprise a plurality of the stocking. Species commonly associated with the aspen forest type in Wisconsin include red maple, paper birch, balsam fir, and select red oaks.

Paper birch.—Forests in which paper birch comprises a plurality of the stocking. Species commonly associated with the paper birch forest type in Wisconsin include aspen, red maple, balsam fir, northern white-cedar, sugar maple, and balsam poplar.

Balsam poplar.—Forests in which balsam poplar comprises a plurality of the stocking. Species commonly associated with the balsam poplar forest type in Wisconsin include balsam fir, aspen, northern white-cedar, paper birch, black ash, and white spruce.

Growing-stock tree.—A live tree of commercial species that meets specified standards of size, quality, and merchantability. (Note: Excludes rough, rotten, and dead trees.)

Growing-stock volume.—Net volume in cubic feet of growing-stock trees 5.0 inches d.b.h. and over, from 1 foot above the ground to a minimum 4.0-inch top diameter outside bark of the central stem or to the point where the central stem breaks into limbs.

Hard hardwoods.—Hardwood species with an average specific gravity greater than 0.50 such as oaks, hard maple, hickories, and ash.

Hardwoods.—Dicotyledonous trees, usually broad-leaved and deciduous. (See Soft hardwoods and Hard hardwoods.)

Improved pasture.—Land currently improved for grazing by cultivating, seeding, irrigating, or clearing trees or brush and less than 16.7 percent stocked with trees.

Indian land.—Land held in trust by the United States for tribes or individual Indians.

Industrial wood.—All roundwood products except residential fuelwood.

Land.—*A. Bureau of the Census.* Dry land and land temporarily or partly covered by water such as marshes, swamps, and river flood plains (omitting tidal flats below mean high tide); streams, sloughs, estuaries, and canals less than one-eighth of a statute mile wide; and lakes, reservoirs, and ponds less than 40 acres in area.

B. Forest Inventory and Analysis. The same as the Bureau of the Census, except minimum width of streams, etc., is 120 feet and minimum size of lakes, etc., is 1 acre.

Live trees.—Growing-stock, rough, and rotten trees 1.0 inch d.b.h. and larger.

Log grade.—A log classification based on external characteristics as indicators of quality or value. Log grade was assigned to a sample of softwood sawtimber trees throughout the State during the 1996 inventory. Also see Tree grade. (See Appendix for specific grading factors used.)

Logging residue.—The unused portions of cut trees, plus unused trees killed by logging.

Marsh.—Nonforest land that characteristically supports low, generally herbaceous or shrubby vegetation, and that is intermittently covered with water.

Merchantable.—Refers to a pulpwood or saw-log section that meets pulpwood or saw-log specifications, respectively.

Miscellaneous Federal land.—Federal land other than National Forest and land administered by the Bureau of Land Management or Bureau of Indian Affairs.

National Forest land.—Federal land that has been legally designated as National Forest or purchase units, and other land administered by the USDA Forest Service.

Net volume.—Gross volume less deductions for rot, sweep, or other defect affecting use for timber products.

Noncommercial species.—Tree species of typically small size, poor form, or inferior quality that normally do not develop into trees suitable for industrial wood products.

Nonforest land.—Land that has never supported forests, and land formerly forested where use for timber management is precluded by development for other uses. (Note: Includes areas used for crops, active Christmas tree plantations as indicated by annual shearing, orchards, nurseries, improved pasture, residential areas, city parks, improved roads of any width and adjoining clearings, powerline clearings of any width, and 1- to 40-acre areas of water classified by the Bureau of the Census as land.) If intermingled in forest areas, unimproved roads and nonforest strips must be more than 120 feet wide and more than 1 acre in area to qualify as nonforest land.

a. Nonforest land without trees.—Nonforest land with no live trees present.

b. Nonforest land with trees.—Nonforest land with one or more trees per acre at least 5 inches d.b.h.

Nonstocked land.—Timberland less than 16.7 percent stocked with all live trees.

Other forest land.—Forest land not capable of producing 20 cubic feet per acre per year of industrial wood crops under natural conditions and not associated with urban or rural development. Many of these sites contain tree species that are not currently utilized for industrial wood production or trees of poor form, small size, or inferior quality that are unfit for most industrial products. Unproductivity may be the result of adverse site conditions such as sterile soil, dry climate,

poor drainage, high elevation, and rockiness. This land is not withdrawn from timber utilization.

Other removals.—Growing-stock trees removed but not utilized for products, or trees left standing but "removed" from the timberland classification by land use change. Examples are removals from cultural operations such as timber stand improvement work and land clearing, and the standing volume on land classified originally as timberland but later designated as reserved from timber harvesting (such as a newly established State park).

Ownership size class.—The amount of timberland owned by one owner, regardless of the number of parcels.

Pasture.—Land presently used for grazing or under cultivation to develop grazing.

Physiographic class.—A measure of soil and water conditions that affect tree growth on a site. The physiographic classes are:

Xeric sites.—Very dry soils where excessive drainage seriously limits both growth and species occurrence. Example: sandy jack pine plains.

Xeromesic sites.—Moderately dry soils where excessive drainage limits growth and species occurrence to some extent. Example: dry oak ridge.

Mesic sites.—Deep, well-drained soils. Growth and species occurrence are limited only by climate. Example: well-drained terraces of loamy soil.

Hydromesic sites.—Moderately wet soils where insufficient drainage or infrequent flooding limits growth and species occurrence to some extent. Example: moderately drained bottomland hardwood sites.

Hydric sites.—Very wet sites where excess water seriously limits both growth and species occurrence. Example: frequently flooded river bottoms and black spruce swamps.

Plant byproducts.—Plant residues used for products such as mulch, pulp chips, and fuelwood.

Plantation.—An artificially reforested area sufficiently productive to qualify as timberland. The planted species is not necessarily

predominant. Christmas tree plantations, which are considered cropland, are not included.

Plant residues.—Wood and bark materials generated at manufacturing plants during production of other products.

Poletimber stand.—(See Stand-size class.)

Poletimber tree.—A live tree of commercial species at least 5.0 inches d.b.h., but smaller than sawtimber size.

Potential productivity class.—A classification of forest land in terms of inherent capacity to grow crops of industrial wood. The class identifies the potential growth in merchantable cubic feet/acre/year at culmination of mean annual increment of fully stocked natural stands.

Private individual land.—Privately owned land not owned by forest industry. This class includes the formerly used Farmer and Miscellaneous private classes.

Reserved forest land.—Forest land withdrawn from timber utilization through statute, administrative regulation, or designation. Note: historically, Christmas tree plantations were classified as reserved forest land. However, Christmas tree plantations are now classified as cropland.

Rotten tree.—Live trees of commercial species that do not contain at least one 12-foot saw log or two saw logs 8 feet or longer, now or prospectively, and/or do not meet regional specifications for freedom from defect primarily because of rot; that is, when more than 50 percent of the cull volume in a tree is rotten.

Rough tree.—(a) Live trees of commercial species that do not contain at least one merchantable 12-foot saw log or two saw logs 8 feet or longer, now or prospectively, and/or do not meet regional specifications for freedom from defect primarily because of roughness or poor form, and (b) all live trees of noncommercial species.

Roundwood products.—Logs, bolts, or other round sections (including chips from roundwood) cut from trees for industrial or consumer uses. (Note: includes saw logs,

veneer logs, and bolts; cooperage logs and bolts; pulpwood; fuelwood; pilings; poles; posts; hewn ties; mine timbers; and various other round, split, or hewn products.)

Salvable dead tree.—A standing or down dead tree considered merchantable by regional standards.

Sapling.—A live tree 1.0 to 5.0 inches d.b.h.

Sapling-seedling stand.—(See Stand-size class.)

Saw log.—A log meeting minimum standards of diameter, length, and defect, including logs at least 8 feet long, sound and straight and with a minimum diameter outside bark (d.o.b.) for softwoods of 7.0 inches (9.0 inches for hardwoods) or other combinations of size and defect specified by regional standards.

Saw-log portion.—That part of the bole of sawtimber trees between the stump and the saw-log top.

Saw-log top.—The point on the bole of sawtimber trees above which a saw log cannot be produced. The minimum saw-log top is 7.0 inches d.o.b. for softwoods and 9.0 inches d.o.b. for hardwoods.

Sawtimber stand.—(See Stand-size class.)

Sawtimber tree.—A live tree of commercial species containing at least a 12-foot saw log or two noncontiguous saw logs 8 feet or longer, and meeting regional specifications for freedom from defect. Softwoods must be at least 9.0 inches d.b.h. Hardwoods must be at least 11.0 inches d.b.h.

Sawtimber volume.—Net volume of the saw-log portion of live sawtimber in board feet, International 1/4-inch rule (unless specified otherwise), from stump to a minimum 7.0 inches top d.o.b. for softwoods and a minimum 9.0 inches top d.o.b. for hardwoods.

Seedling.—A live tree less than 1.0 inch d.b.h. that is expected to survive. Only softwood seedlings more than 6 inches tall and hardwood seedlings more than 1 foot tall are counted.

Short-log (rough tree).—A sawtimber-size tree of commercial species that contains at least one merchantable 8- to 11-foot saw log but not a 12-foot saw log.

Shrub.—A woody, perennial plant differing from a perennial herb in its persistent and woody stem(s) and less definitely from a tree in its lower stature and/or the general absence of a well-defined main stem. For this report, shrubs were separated somewhat arbitrarily into tall and low shrubs as follows:

Tall shrubs.—Normally taller than 1.6 to 3.2 feet (0.5 to 1.0 meter).

Low shrubs.—Normally shorter than 1.6 to 3.2 feet (0.5 to 1.0 meter). (Woody perennial vines, such as grape, were included with low shrubs.)

Shrub and tree seedling biomass.—The total aboveground weight of trees less than 1.0 inch in diameter and all shrubs.

Site index.—An expression of forest site quality based on the height of a free-growing dominant or codominant tree of a representative species in the forest type at age 50.

Soft hardwoods.—Hardwood species with an average specific gravity less than 0.50, such as cottonwood, red maple, basswood, and willow.

Softwoods.—Coniferous trees, usually evergreen, having needles or scale-like leaves.

Stand.—A group of trees on a minimum of 1 acre of forest land that is stocked by forest trees of any size.

Stand-age class.—A classification based on age of the main stand. Main stand refers to trees of the dominant forest type and stand-size class.

Stand-size class.—A classification of stocked (see Stocking) forest land based on the size class of live trees on the area; that is, sawtimber, poletimber, or seedlings and saplings.

Sawtimber stands.—Stands with half or more of live tree stocking in sawtimber or poletimber trees, and with sawtimber stocking at least equal to poletimber stocking.

Poletimber stands.—Stands with half or more of live tree stocking in poletimber and/or sawtimber trees, and with poletimber stocking exceeding that of sawtimber.

Sapling-seedling stands.—Stands with more than half of the live tree stocking in saplings and/or seedlings.

State land.—Land owned by the State of Wisconsin or leased to it for 50 years or more.

Stocking.—The degree of occupancy of land by live trees, measured by basal area and/or the number of trees in a stand by size or age and spacing, compared to the basal area and/or number of trees required to fully utilize the growth potential of the land; that is, the stocking standard. A stocking percent of 100 indicates full utilization of the site and is equivalent to 80 square feet of basal area per acre in trees 5.0 inches d.b.h. and larger. In a stand of trees less than 5 inches d.b.h., a stocking percent of 100 would indicate that the present number of trees is sufficient to produce 80 square feet of basal area per acre when the trees reach 5 inches d.b.h.

Stands are grouped into the following stocking classes:

Overstocked stands.—Stands in which stocking of live trees is 133.0 percent or more.

Fully stocked stands.—Stands in which stocking of live trees is from 100.0 to 132.9 percent.

Medium stocked stands.—Stands in which stocking of live trees is from 60.0 to 99.9 percent.

Poorly stocked stands.—Stands in which stocking of live trees is from 16.7 to 59.9 percent.

Nonstocked areas.—Timberland on which stocking of live trees is less than 16.7 percent.

Timber products output.—All timber products cut from roundwood and byproducts of wood manufacturing plants. Roundwood products include logs, bolts, or other round sections cut from growing-stock trees, cull trees, salvable dead trees, trees on nonforest land, noncommercial species, sapling-size trees, and limbwood. Byproducts from

primary manufacturing plants include slabs, edging, trimmings, miscuts, sawdust, shavings, veneer cores and clippings, and screenings of pulpmills that are used as pulpwood chips or other products.

Timberland.—Forest land that is producing, or is capable of producing, more than 20 cubic feet per acre per year of industrial wood crops under natural conditions, that is not withdrawn from timber utilization, and that is not associated with urban or rural development. Currently inaccessible and inoperable areas are included. (Timberland was formerly called commercial forest land.)

Tree.—A woody plant usually having one or more erect perennial stems, a stem diameter at breast height of at least 3 inches, a more or less definitely formed crown of foliage, and a height of at least 13 feet at maturity.

Tree biomass.—The total aboveground weight (including the bark but excluding the foliage) of all trees from 1 to 5 inches in d.b.h., and the total aboveground weight (including the bark but excluding the foliage) from a 1-foot stump for trees more than 5 inches in diameter.

Tree grade.—A classification of the lower 16 feet of the bole of standing trees based on external characteristics as indicators of the quality and quantity of lumber that could be produced from the tree. Tree grade was assigned to a sample of hardwood sawtimber trees during the 1996 inventory. Also see Log grade. (See Appendix for specific grading factors used.)

Tree size class.—A classification of trees based on diameter at breast height, including sawtimber trees, poletimber trees, saplings, and seedlings.

Upper stem portion.—That part of the bole of sawtimber trees above the saw-log top to a minimum top diameter of 4.0 inches d.o.b. or to the point where the central stem breaks into limbs.

Urban and other areas.—Areas within the legal boundaries of cities and towns; suburban areas developed for residential, industrial, or recreational purposes; school yards; cemeteries; roads; railroads; airports;

beaches; powerlines and other rights-of-way; or other nonforest land not included in any other specified land use class.

Urban forest land.—Land that would otherwise meet the criteria for timberland, but is in an urban-suburban area surrounded by commercial, industrial, or residential development and not likely to be managed for the production of industrial wood products on a continuing basis. Wood removed would be for land clearing, fuelwood, or esthetic purposes. Such forest land may be associated with industrial, commercial, residential subdivision, industrial parks, golf course perimeters, airport buffer strips, and public urban parks that qualify as forest land.

Water.—(a) *Bureau of the Census*.—Permanent inland water surfaces, such as lakes, reservoirs, and ponds at least 40 acres in area; and streams, sloughs, estuaries, and canals at least one-eighth of a statute mile wide.

(b) *Noncensus*.—Permanent inland water surfaces, such as lakes, reservoirs, and ponds from 1 to 39.9 acres in area; and streams, sloughs, estuaries, and canals from 120 feet to one-eighth of a statute mile wide.

Wooded pasture.—Improved pasture with more than 16.7 percent stocking in live trees, but less than 25 percent stocking in growing-stock trees. Area is currently improved for grazing or there is other evidence of grazing.

Wooded strip.—An acre or more of natural continuous forest land that would otherwise meet survey standards for timberland except that it is less than 120 feet wide.

¹ This table is based on the stocking percent of growing-stock trees, rather than that of "live" trees. For this table, to use the definition of stocking found in the Appendix, replace the term "live trees" with "growing-stock trees."

² Area of nonstocked in this table and in Table 8 differs from that in other tables in this report because this table includes land stocked only with growing-stock trees, rather than with "live" trees.

¹ An estimate of current gross growth may be computed by adding current mortality to current net growth.

² Based on data from a 1995 pulpwood survey, a 1994 survey of other primary wood using mills, a 1994 residential fuelwood survey, regional logging utilization studies, and land-use change estimates from the new inventory.

³ International 1/4-inch rule.

Schmidt, Thomas L.

1998. **Wisconsin forest statistics, 1996.** Resour. Bull. NC-183. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station. 150 p.

The fifth inventory of Wisconsin's forests reports 34.8 million acres of land, of which 16.0 million acres are forested. This bulletin contains detailed tables of area, volume, growth, removals, mortality, and ownership.

KEY WORDS: Forest area, timber volume, growth, removals, mortality.
